PREFATORY NOTE.

The principal points in which the ENCYCLOPÆDIC DICTIONARY differs from other dictionaries are fully discussed in the Preface, but it may be well to draw attention to the following:

(1) Compound Words are inserted under the first element of the compound, and not in the place they would occupy in strictly alphabetical order, if the second element were taken into account. Thus ANT-BEAR is inserted after ANT, and not after ANTATROPHIC.

(2) The Pronunciation is indicated by diacritical marks, a key to which will be found at the foot of the several pages, but the division into syllables has been based solely on pronunciation, and with no reference to the etymology of the word. In syllables wherein two or more vowels come together, not forming diphthongs, only that one of them which gives its sound to the syllable bears a diacritical mark, the others being treated as mute. Thus, in *brĕad*, *sēa*, *flōat*, the *a* is mute, the syllables being pronounced as if spelt *brĕd*, *sē*, *flōt*. Words of more than one syllable bear a mark upon the accented syllable, as *ăl'-tĕr*.

(3) The Etymology will be found enclosed within brackets immediately following each word. To understand the plan adopted, let it be noted (1) that retrogression is made from modern languages to ancient; and (2) that when after a word there appears such a derivation as this—"In Fr. . . . Sp. . . . Port. . . . Ital. . . . from Lat. . . .," the meaning is, not that it passed through Italian, Portuguese, Spanish and French before reaching English, but that there are or have been analogous words in French, Spanish, Portuguese and Italian, all derived like the English, from a Latin original.

The following List, which contains the principal abbreviations employed in the ENCYCLOPÆDIC DICTIONARY, is inserted here for the convenience of persons using the work for the first time. Philosophy of Rhetoric, and, in the year 1826, Archbishop Whately issued his *Elements of Rhetoric*. Campbell (*Phil. of Rhetoric*, bk. i., ch. i.) considers the art the same as eloquence, and defines it as "That art or talent by which the discourse is adapted to its end," and states that the ends of speaking (or writing) are reducible to four, to enlighten the understanding, to please the imagination, to move the passions, or to influence the will. Broadly speaking, the aim of rhetoric is to expound the rules governing prose composition, or speech designed to influence the judgment or the feelings. It includes, therefore, within its province, accuracy of expression, the structure of periods, and figures of speech.

2. The art which teaches oratory; the rules which govern the art of speaking with propriety, elegance, and force.

3. Rhetoric exhibited in language; artificial eloquence, as opposed to natural or real eloquence; declamation; showy oratory.

"He acquired a boundless command of the *rhetoric* in which the vulgar express hatred and contempt."—*Macaulay: Hist. Eng.*, ch. iv.

* 4. The power of persuading or influencing: as, the *rhetoric* of the eyes.

rheŭ'-ma-tĭzm, *s.* [Lat. *rheumatismus*; Gr. ῥευματισμός (*rheumatismos*), from ῥεῦμα (*rheuma*).] [Rheuma (1).]

Pathol.: Acute articular rheumatism or rheumatic fever is produced by the presence in the blood of a poisonous material (probably lactic acid in excess), generated within the system by some derangement of the nutritive and elementary processes. The ordinary causes are exposure to cold and damp, sudden chill, sitting in wet clothes or in a cold draught, and scarlatina also sometimes produces it in children. It is a distinctly hereditary disease, chiefly attacking persons from fifteen to thirty-five years of age, but no time of life is exempt. Affections of the heart are present in most acute cases, particularly pericarditis, with the blowing, bellows-like murmur so characteristic of this complication, and this is apt to be permanent. It is usual for many attacks to follow through life, and in the young chorea, or St. Vitus's dance, is a common sequent. The joints become swollen, red, hot, and painful even to agony. Relief of pain and alkalinity of the blood are the most necessary indications for the successful treatment of rheumatism. It frequently becomes chronic, and assumes other forms as well as the articular, or rheumatism of the joints, such as myalgia, or muscular rheumatism, wry-neck, lumbago, gonorrhœal rheumatism, and *Arthritis deformans*, in which deformity and twisting of the joints is the most prominent characteristic.

1. *Zoology:*

(1) The sole recent genus of the family Rhinocerotidæ (q.v.). It falls naturally into three sections, which some zoologists raise to the rank of genera.

(*a*) *Rhinoceros:* Adults with a single large compressed incisor above on each side, occasionally a small lateral one, below a very small median, and a very large procumbent, pointed, lateral incisor; nasal bone pointed in front; single nasal horn; skin very thick, and raised into strong, definitely-arranged folds. There are two well-marked species: (1) *Rhinoceros unicornis* (Linnæus; *indicus*, Cuvier), now found wild only in the terai region of Nepal and Bhotan and in Assam, though it had formerly a much wider geographical range; (2) *R. sondaicus* (or *javanus*, Cuvier), the Javan Rhinoceros, is smaller, and distinguished by the different arrangement of the folds of the skin, and by the small size or absence of the horn in the female. Found near Calcutta, in Burmah, Malay Peninsula, Java, Sumatra, and probably Borneo. *R. unicornis* was known to the ancients, and was seen probably for the first time by modern Europeans when one was sent to the king of Portugal from India in 1513.

(*b*) *Ceratorhinus:* The folds are not so strongly marked as in the first section. There is a well-developed nasal, and a small frontal horn, separated by an interval. The name, *R. sumatrensis* has possibly been applied to more than one species, and two animals in the Zoological Gardens, Regent's Park, presented considerable differences of form and colour. Dr. Sclater named one of them *R. lasiotis*, the Hairy-Eared Rhinoceros. Geographical range nearly the same as that of the Javan Rhinoceros, but it does extend into Bengal.

(*c*) *Atelodus*, with two well-marked species, peculiar to Africa. Incisors rudimentary or wanting, well-developed anterior and posterior horns in close contact; skin without definite permanent folds. *R. bicornis*, the Common Two-horned Rhinoceros, is the smaller, and has a pointed prehensile lip. It ranges from Abyssinia to Cape Colony, but the progress of civilization and the attacks of English sportsmen are rapidly reducing its numbers. Two varieties are said to exist, *R. bicornis major* and *R. bicornis minor*. Specimens in which the posterior horn has attained a length as great as or greater than the anterior have also been separated under the specific name of *R. keitloa* [KEITLOA], but with scarcely sufficient reason. *R. simus*, Burchell's, the Square-mouthed, or White Rhinoceros, has a square truncated lip, browses on grasses, and frequents open country. It is the largest of the family, an adult male standing over six feet at the shoulder. The epithet White is a misnomer, for the animal is a dingy slate-colour. A local variety in which the horn has a forward rake is sometimes described as *R. oswellii*.

(2) Any individual of the genus Rhinoceros [(1)]. The rhinoceros is the largest and most powerful terrestrial mammal, except the elephant, to which, as well as to the hippopotamus and tapir, it is allied. They are of low intelligence, and usually harmless, but when provoked they display considerable ferocity, and, though apparently so clumsily formed, can run with great speed. Only one is produced at a birth. The flesh is sometimes used for food; in the East Indies, the skin, which is said to be bullet-proof at short distances, is used for shields, and in South Africa it is made into whips.

2. *Palæont.: R. pachygnathus*, from the Miocene of Greece, was apparently intermediate between *R. bicornis* and *R. simus*. Four species, all bicorn, formerly inhabited Britain: *R. tichorhinus*, the Woolly Rhinoceros (q.v.), from the Brick-earths of the Thames Valley, *R. hemitœchus* (Falc., *leptorhinus*, Owen), *R. megarhinus* (*leptorhinus*, Cuvier & Falc.) and *R. etruscus*, of Pliocene age. The one-horned Indian type was well represented (*R. sivalensis*, *R. palœindicus*) in the Pleistocene of the sub-Himalayan region. *R. schleirmacheri*, of the late European Miocenes, possessed incisors and was bicorn.

Chem.: A tetratomic metallic element belonging to the platinum group, symbol Rh; atomic weight, 104·4; sp. gr. 10·6 to 12; discovered by Wollaston in 1804 in crude platinum. To obtain it, the solution from which platinum, palladium, and iridium have been separated is mixed with hydrochloric acid, evaporated to dryness, and the residue treated with alcohol of sp. gr. 0·837, which dissolves everything except the double chlorides of rhodium and sodium. On filtering, heating the residue to dryness, and boiling with water, metallic rhodium remains. It is a whitish-gray metal, very hard, less fusible and less ductile than platinum, unalterable in the air at ordinary temperatures, but oxidising at a red heat. When pure it is unacted upon by the strongest acids, but when alloyed it dissolves in nitro-hydrochloric acid. Rhodium forms but one chloride, $RhCl_3$, a brownish-red deliquescent mass, soluble in water. It forms four oxides: monoxide, RhO, a dark-gray substance, unattacked by acids; sesquioxide or rhodic oxide, Rh_2O_3, a gray porous mass, with a metallic iridescence; dioxide, RhO_2, a dark-brown substance; and trioxide, RhO_3, a blue flocculent powder, all insoluble in acids. The salts of rhodium are for the most part rose-coloured.

rhodizonic-acid, *s.*

Chem.: A name applied to two distinct compounds, produced under different circumstances from potassium carboxide. α-Rhodizonic acid, $C_6H_4O_6 = (C_5HO_3)'''_{H_3}\}O_3$, discovered by Heller in 1837, is formed from carboxylic acid by the assumption of water, $C_{10}H_4O_{10} + 2H_2O = 2C_5H_4O_6$. It crystallizes in colourless rhombic prisms, easily soluble in water and alcohol. On exposure to the air the crystals turn brownish-red, heated to 100° they turn black, at a higher temperature they decompose, leaving a carbonaceous residue. The α-rhodizonates, produced from the hydro-carboxylates, are all red, and very insoluble. β-Rhodizonic acid, $C_{10}H_6O_8$. This acid is unknown in the free state, but its potassium salt, $C_{10}K_6O_8$, discovered by Brodie in 1859, remains undissolved when potassium carboxide is treated with absolute alcohol. It is distinguished from α-rhodizonate by the rapidity with which it absorbs oxygen on exposure to air and moisture, being converted into potassium croconate.

rhû′-barb, * reu-barbe, * rew-barb, * ru-barbe, *s. & a.* [O. Fr. *rheubarbe* (Fr. *rhubarbe*), from Low Lat. *rheubarbarum* (= *rheum barbarum*), from Gr. *ῥῆον βαρβαρον* (*rhēon barbaron*) = rhubarb; lit. the *rheum* from a

barbarian country. Gr. *ῥῆον* (*rhēon*) is an adjectival form, from *Rha* the old name of the Volga, on the banks of which the rhubarb is indigenous. Sp. *riubarbo*; Port. *rheubarbo*; Ital. *reubarbaro*, *reobarbaro*.]

A. *As substantive:*

1. *Bot.:* [Rheum].

2. *Hort., &c.:* The common Garden Rhubarb is *Rheum Rhaponticum*, though some of the red-stalked rhubarb is from *R. undulatum*. The former plant has broadly cordate leaves, strongly veined beneath. The footstalks are long, thick, and fleshy, with a channel above. Its growth is exceedingly rapid. It was brought, about 1573, from the banks of the Volga, where it is wild. Since 1820 the stalks have been used for tarts, and made into jam.

3. *Pharm.:* Three leading kinds of rhubarb are recognized: (1) The Turkey or Russian rhubarb, which is wild neither in the one country nor the other, but used to be brought to Europe from China *viâ* Turkey, and then from China *viâ* Russia; (2) the East Indian, and (3) the Batavian rhubarb. An extract, an infusion, a syrup, a tincture, and a wine of rhubarb, with a compound rhubarb pill, are used in pharmacy. In small doses rhubarb is stomachic and slightly astringent; in large doses, a purgative, but its action is followed by constipation. [Gregory's powder.]

*** B.** *As adj.:* Bitter.

"With your *rhubarb* words."
Sidney: Astrophel & Stella, xiv.

rhŭs, *s.* [Lat., from Gr. *ῥοῦς* (*rhous*) = *Rhus Cotinus* (?).]

1. *Bot.:* A genus of Anacardiaceæ. Leaves simple or compound. Flowers in axillary or terminal panicles, bisexual or polygamous. Calyx small, persistent, five-partite; petals five; stamens five; ovary one-celled, sessile; fruit a dry drupe, with one exalbuminous seed. Nearly a hundred species are known. Most are shrubs, from six to ten feet high. They exist in all the continents. *R. typhina*, the Virginian or Stag's-horn Sumach, *R. coriaria*, the Hide Sumach of Europe, and *R. cotinus* of India, yield leaves which are used in tanning leather. The Smooth-leaved Sumach (*R. glabra*), of the United States, has very acid leaves and fruit. The poisonous species of this country are *R. toxicodendron*, the Poison Ivy or Poison Oak, and *R. venenata*, the Swamp Sumach or Poison Elder. These cause severe skin eruptions, with violent itching, to some persons, from handling or even standing near them. In India, *R. parriflora*, *R. semialata*, *R. succedanea* are used medicinally. Exudations from incisions in the bark of *R. succedanea* and *R. vernicifera* yield the varnish used in Japanese and Chinese wickerwork. The former produces astringent galls, and its seeds yield a kind of wax; as do also those of *R. Wallichii* and the Japanese *R. vernix*. The juice of the latter species blisters the skin. The Turks use the acid fruits of *R. coriaria* to sharpen their vinegar. The plant yields sumach (q.v.). The wood of *R. Cotinus* is employed for inlaid and cabinet work. [Fustic.]

1. The measure of time or movement by regularly recurring motions, impulses, sounds, &c., as in poetry, prose, and music, and, by analogy, in dancing; periodical emphasis; numerical proportion or harmony. In poetry rhythm is the regular succession of arses and theses, or of long and short (heavy and light) syllables in a verse. In prose it is an arrangement of words in an expressive and pleasing succession; but its regularity is not so great that it can be reduced to a law. When it can be reduced to a law, it loses the name of *rhythm* and becomes *metre.* In music rhythm is the disposition of the notes of a composition in respect of time and measure; the measured beat which marks the character and expression of the music. In dancing, the rhythm is recognised in the sound of the feet.

"When we talk or write continuously about any subject that appeals to the passions, we gratify a natural instinct by falling into a certain regularity. Both the voice and the arrangement of the words fall under this regular influence: the voice is modulated, and the words are regulated in a kind of flow called *rhythm.* Without *rhythm*, the expression of passion becomes spasmodic and painful, like the sobbing of a child. *Rhythm* averts this pain by giving a sense of order controlling and directing passion. Hence *rhythm* is in place wherever speech is impassioned, and intended at the same time to be pleasurable; and impassioned speech without *rhythm* is, when long continued, unpleasing."—*Abbott & Seeley: Eng. Lessons for Eng. People*, § 91.

2. Rhyme, metre, verse, number.

3. *Physiol.:* The proportion as to time between the action of an organ, an intermittent or remittent disease, &c., at successive periods. Only one species known, *Rhytina stelleri*, the northern Sea-cow. It was discovered by Steller, a German naturalist in the Russian service, in 1741, and was then extremely abundant round Behring's and Copper Island in the North Pacific. The last was supposed to have been killed in 1768, but "Nordenskiöld obtained information from the natives of Behring's Island which led him to believe that a few individuals may have survived to a much later date, even to 1854" (*Encyc. Brit.* (ed. 9th), xv. 391. Note). The habits of the Rhytina were similar to those of the Manatee, which it greatly exceeded in size, attaining a length of about twenty-five feet. Steller published an excellent account of its anatomy and habits, and quantities of its remains have since been discovered. A nearly perfect skeleton from Behring's Island has been placed in the Natural History Museum, South Kensington.

The members were bound together by an oath, had pass-words, signs, &c., and met in lodges. The name was derived from the piece of green ribbon worn as a badge in the button-hole.

"The main object of the *Ribbon Society* was to prevent any landlord, under any circumstances whatever, from depriving a tenant of his land. 'Fixity of tenure,' which has lately been so boldly demanded by the advocates of tenant-right, was then only secretly proclaimed in the lodges of the *Ribbon Society*, and 'fixity of tenure' it was determined to carry out to the death. The second object was to deter, on pain of almost certain death, any tenant from taking land from which any other tenant had been evicted."—*Trench: Realities of Irish Life*, ch. iv.

Sometimes small fields are surrounded by an earthen rampart descending from which one will sink ankle deep in mud. Rice is very extensively cultivated in India, especially in Bengal, in the Eastern Peninsula and Islands, and in China. It constitutes half the cereal crop of Africa. In 1700 it was accidentally introduced into the Southern States of America, and is now largely grown there. To a less extent it is grown in Southern Europe. It probably supports a larger number of the human race than any other cereal, or indeed than any other plant. It contains 85 per cent. of starch, and is considered less nutritious than wheat. Professor Watt says that the husked seeds and the flour are demulcent and diuretic. In India they are sometimes used in diseases of the urinary organs and in catarrh, also as an external application to burns and scalds.

Rep.*, iv. 60) reduces them to three sections: (1) small-seeded, (2) large-seeded, (3) a form grown, on account of its leaves, as food for the Eria silkworm. The small-seeded form is grown as a crop, the large-seeded one as a hedge. The seeds furnish castor oil, and are also used by dyers to render colours permanent. Persons camping near a field of the plant are apt to be attacked with diarrhœa. The fresh juice is used as an emetic; made into a poultice with barley-meal it is used in inflammation of the eye. 1. The term applied to any musket or gun-barrel which is grooved so that the projectile may have a rotatory motion on its own axis. The rifling may be polygroove as in the Armstrong and other guns, with only two grooves as in some of the early weapons, with the two grooves with the angles rounded away so as to produce an oval and yet twisted bore as in the Lancaster guns, or with three or more grooves as in most modern weapons. The grooves are of varying size, form, and width, and of different degrees of twist in the length of the barrel itself, that of the Henry rifling being one turn in twenty-two calibres or widths of the bore. The bullet is made to fit the bore either by expansion of the base of the lead bullet, or, as in the early pattern, by having the ball "belted," so that the belt should take the groove and so emerge from the muzzle with a rotatory motion. The utility of the *Magazine rifle*, a firearm having attached to it a magazine or case containing four or more cartridges capable of being fed successively into the barrel, was first demonstrated in the United States Civil War, in which it was brought to some extent into use. It was still more fully demonstrated in 1877 when the Turks, armed with Winchester repeating rifles, constantly repulsed the Russian assaults on the works before Plevna. The Springfield rifle, formerly used by the United States army, was supplanted by the Winchester and other small-bore repeaters, and these are now giving place to the new Krag-Jorgensen rifle, also a repeater of small calibre, which throws a pencil-shaped steel projectile a distance of from three to five miles. The European nations have generally adopted magazine rifles.

Sansc. Literature: The oldest and most original of the four Vedas, and probably the oldest literary composition in the world. In all likelihood it was in course of composition about 1,400 years B.C., but was not committed to writing at that time. It contains no allusion to writing or writing materials, and Max Müller believes that for a long period it was transmitted orally from generation to generation. It consists of 1,017 short lyrical poems, with 10,580 verses. The religion was nature worship, Indra, the Cloud-compeller, being the chief object of adoration, and, after him, Agni (cf. Lat. *ignis*) the God of fire. The Hindoo Triad had not yet arisen. [Veda.] The Rig Veda does not recognize the institution of caste. Beef was eaten. 1. A correspondence of sound in the final syllable or syllables of two or more words; especially the correspondence in sound of the final syllable or word of one line of poetry with the final syllable or word of another. Three things are essential to a perfect rime:—

(1) Identity in the vowel sound, and, if the words end in a consonant, in the consonants also, as in *try* and *cry, sight* and *light*. Identity of letters is not enough, the identity must be one of sound; thus, *close* and *lose, heath* and *death* are not rimes.

(2) Difference in the consonants preceding the vowel, as *way* and *lay, find* and *mind*.

(3) Similarity of accent, as *sing* and *fling; singing* and *fling* would not be good rimes.

¶ Words like *oar* and *o'er, eye* and *I*, are assonances [ASSONANCE]. Rimes in which the final syllables alone correspond are called single or masculine (male) rimes, as *band, hand*; those in which the two final syllables correspond, the first being accented, are called double or feminine (female) rimes, as *crying, trying*. Triple rimes extend over three syllables, as *scrutiny, mutiny; dutiful, beautiful*.

"Things unattempted yet in prose or *rime*."

II. *Technically:*

1. *Geog.:* A large stream of water flowing over a certain portion of the earth's surface, and discharging itself into the sea, a lake, a marsh, or another river. A river is generally a stream of considerable size formed by the union of several brooks, streams, or rivulets. When several streams join, so as to produce a river of considerable size, this last is called the principal river, and the minor rivers of which it is composed are called its tributaries, affluents, branches, or feeders. The district drained by such a system of streams or rivers is termed a river-basin (q.v.). Rivers generally have their sources in springs, or from the gradual melting of the snow and ice which perpetually cover the summits of the most elevated ranges of mountains. The channel or cavity in which a river flows is called its bed, and the solid land which borders the bed is its banks. The termination of the course of a river, or where it discharges itself into the sea, another river, &c., is called its mouth.

The following table shows the length and area of some of the principal rivers:—

	Length in miles.	*Area of Basin. Sq. miles.*
Mississippi, with Missouri	4,100	1,290,000
Nile	3,700	1,290,000
Amazon	3,400	2,230,000
Obi	3,200	1,190,000
Yang-tse-Kiang	3,200	689,000
Yenesei	3,200	880,000
Lena	2,900	942,000
Amur	2,800	403,000
Congo	2,600	1,540,000
Niger	2,600	1,060,000

Darwin (*Descent of Man*, pt. i., ch. vi.) considered rivers as harbours of refuge for certain fishes, and as standing to the ocean in the same relation as islands do to continents.

2. *Geol.:* Rivers may in some cases be aided in hollowing out their beds by existing ravines and fissures, in others their whole channel is scooped out by themselves. The most rapid movement of the water is at the surface, friction retarding the lower and lateral currents. A velocity of three inches per second at the bottom is sufficient to tear up fine clay, six inches per second fine sand, twelve inches per second fine gravel, and three feet per second stones as large as an egg. Hence the transporting power of a river is enormous, especially when in flood. The material carried forward is deposited in the estuary at the mouth of the stream, and tends to form a delta (q.v.). Rivers have existed in all geological periods; one is traceable in the Carboniferous rocks of the Forest of Dean.

3. *Law:* Rivers are distinguished as navigable and non-navigable: the former being the property of the state, and subject to state jurisdiction; the latter the property of those through whose lands they flow. Improvements in many of our inland navigable rivers, by means of dams and locks, are now being made by the Government at public expense. The Ohio and some of its tributaries have been greatly improved by this method during the last few years.

Compar. Religions: An expression frequently met with in anthropological writings, and derived from the fact that, in very many forms of religion, the passage from the present to another state of existence is thought to be effected by the actual crossing of a river. The belief existed in classical times (cf. *Virg. Æn.* vi. 134, 145, with *Od. μ.* 22), and is very widely spread among races of low culture in the present day (*Tylor: Prim. Cult.*, ch. xii., xiii.). When used for joining pieces of leather, as in making belting, an annular disc, termed a burr, is placed over this end previous to swaging, in order to give a greater bearing. Rivets are cut from round metal rods, and formed by special machinery. In riveting iron plates together, as in boilers, tanks, &c., the rivet is made red-hot, and while a sledge is held against the head, the end is swaged down by striking directly with a riveting-hammer, or a species of die called a snap-head is interposed. In riveting together wooden surfaces, they may be lined with metallic plate, or washers may be placed under the head and the swaged burr, to prevent the indentation of the wood.

II. *Geol.:* Any portion of the earth's crust, coherent or incoherent, any sedimentary stratum or any dyke or overlying mass of volcanic or plutonic mineral matter. The older writers drew a distinction between rocks and soils. Both are now regarded as rocks. So are blown sand, silt, mould, and peat; though the last is soft, spongy, and of vegetable origin. Were the vegetable character to exclude it, coal would have to be omitted too. Most rocks, originally soft, have become hard and compact by losing their moisture, and being subjected to pressure. As a rule a rock is not a bed of some simple mineral. In most cases there are crystals cemented together by imperfectly crystalline or amorphous matter, or there is a mixture of angular and rounded grains, also bound together by mineral matter. [Mineral.] Viewed as to composition, there are three leading classes of rock: Siliceous or Arenaceous, some formed of loose sand, others of hard sandstone, with all intermediate grades; Argillaceous rocks, *i.e.* rocks of clay, or more specifically having one-fourth alumina to three-fourths silica; and Calcareous rocks composed chiefly of carbonate of lime, some of them proved, and most of the others suspected, to be originally composed of various organisms. Viewed as to their origin, Lyell long recognized four kind of rocks: Aqueous or Sedimentary, Volcanic, Metamorphic, and Plutonic (all which see). A fifth category has now been superadded, viz., Aërial or Æolian, formed by the action of wind. Aqueous, Æolian, and Metamorphic rocks are, as a rule, stratified; Volcanic and Plutonic rocks generally unstratified: the last two are called igneous. Some stratified rocks are unfossiliferous, others fossiliferous. For the stratigraphical or chronological order of the latter, see Fossiliferous. Much light has recently been thrown on the composition and origin of rocks, by subjecting thin sections of them to microscopic examination. [Geology.]

Roent′-gĕn's method, *s.* [After Wilhelm Conrad Roentgen, Professor of Physics at the University of Wurzburg, Germany.]

Roentgen rays, *s.*

Photog.: A hitherto unknown manifestation of force or energy, recently discovered by Professor Roentgen, reported by him to the Medico-Physical Society of Wurzburg on December 4, 1895, and since verified by numerous investigators throughout the scientific world. This manifestation is a result of the action of the secondary electric or induction current upon highly exhausted vacuum tubes, and is entirely distinct from the so-called "cathode rays" produced by this current within such tubes and first described by Crookes as "radiant matter" and more lately and fully studied by Hirtoff, Hertz and Lenard.

The most notable quality of the Roentgen rays—or, as he terms them, of the X-rays—is the ability to penetrate considerable thicknesses of substances heretofore considered opaque to all known forms of light, besides which they are also capable, either before or after such penetration, of acting actinically upon ordinary photographic plates and of producing fluorescence in certain chemical compounds. And, as the permeability of various substances to these rays depends largely, though not altogether, upon their respective densities, it is therefore possible to make upon sensitive photographic plates outline- or shadow-pictures of objects entirely hidden from normal sight, or to render these visible by interposing a fluorescent screen between them and the eye. Thus shadowgraphs or skiagraphs have been made of metal articles enclosed in wooden boxes, of coins, &c. in purses, of the bones in the living body, &c. (see illustrations), and by means of the skiascope these same objects become immediately visible to the observer.

It is interesting to note the degree of transparency of various common substances. Cork and paper are very transparent; so is water and several other fluids, but not so much so as cork. Wood, ebonite, vulcanite and animal flesh are readily penetrated and for considerable thicknesses; one observer has secured good results thorough eight inches of wood and Nikola Tesla has recently obtained a good skiagraph of the ribs, clavicle, scapula, &c. of the living adult. Of the metals, Roentgen reports platinum as the most opaque and aluminium the most transparent of those examined; the latter being about 200 times more permeable than the former. Lead is three and zinc six times as permeable as platinum. Salts of metals are about as transparent as their respective metals. Glass is comparatively opaque to the rays, having about the same degree of permeability as aluminium. The true nature of the rays is still uncertain and the subject of much discussion. It is known that they pass in straight lines and apparently have their origin on the surface, and not within the vacuum (Crookes') tubes from which they emanate. They are perfectly invisible to the human eye, and only manifest their results, so far as we now know, by producing fluorescence or by acting on photographic emulsions. Inasmuch as ultra-violet light has the power of producing fluorescence and of penetrating to a degree certain substances ordinarily considered opaque, some have thought that the Roentgen rays are similar in nature to light. But Roentgen himself did not think that this could be so, inasmuch as he was unable to refract, reflect or polarize the rays by any methods he was able to employ, and he suggests the possibility of their being due to longitudinal instead of the transverse vibrations in the ether—an entirely new form of force-transmission. However, Tesla has very recently succeeded in deflecting the rays by means of zinc and other metals, and it is possible that they still may be found to obey the laws of ordinary light and to be due to transverse ether vibrations of peculiar wave length and frequency. It is also as yet unknown whether they have any other source than the vacuum or Crookes' tubes, but the writer and others have succeeded in obtaining skiagraphs and other photographic effects by means of sunlight and by artificial light through aluminium plates one millimeter in thickness, as well as through vulcanite and other opaque substances. The immediate future will doubtless be prolific of much information concerning this new and wonderful discovery. (*Seneca Egbert, M.D., April 10, 1896.*)

¶ *The Epistle of Paul the Apostle to the Romans:*

New Test. Canon: The first in arrangement (not in date) of St. Paul's Epistles. It was written from Corinth (cf. xvi. 23 with 1 Cor. i. 14; 2 Tim. iv. 20) on his third missionary journey, apparently in the spring of A.D. 58, a year after the First, and half a year after the Second Epistle to the Corinthians, and a few months after the Epistle to the Galatians (cf. Rom. xv. 25, 26 with Acts xix. 21, xx. 1–3, xxi. 15). In writing it he employed an amanuensis, Tertius (Rom. xvi. 22), and sent it by the hand of Phebe, a servant to the church at Cenchrea, the port of Corinth (verse 1). When Paul penned it he had never been to Rome (Acts xix. 21; Rom. i. 10–13, &c.), and had not, therefore, directly founded its church. Among those present on the day of Pentecost, there were "strangers of Rome, Jews, and proselytes" (Acts ii. 10). If, as is possible, some of them returned home after seeing the miracle, and listening to the impassioned preaching of St. Peter, they may have been the first to sow the seeds of Christianity in the metropolis, and Peter have been the indirect founder of the Roman Church. The tradition that he founded it more directly, A.D. 41, originated with Jerome, who died A.D. 420, and is difficult to reconcile with Acts xv. 7–11, and Gal. ii. 1–9. It is remarkable that St. Paul makes no allusion in his epistle to any pastor of the Roman Church, as if it had not been organized under ecclesiastical officers. The Church seems to have been partly Jewish (ii. 14–17, vii. 1), and partly Gentile (i. 6, 13, xi. 13). The epistle opens with an introduction in which Paul declares his apostleship (i. 1–7), commends the faith of the Roman Christians, whom he earnestly desires to visit (8–13), proclaims that he is not ashamed of the gospel of Christ (14–17), and then glides almost insensibly into the most systematic treatment of Christian doctrine and practice to be found in the New Testament. Trying the Roman and other parts of the Gentile world by the light of nature (19–20), he shows how fearfully corrupt the heathens then were, and how destitute of excuse for their conduct (18–32). The Jew is next shown to have flagrantly violated the Divine law revealed to him, and it is proclaimed that all the world stands guilty before God (ii., iii. 1–19). Justification is in no case to be obtained by the "deeds of the law" (20), but is granted freely by God's grace to those who have faith in the propitiatory sacrifice of Christ (23–31). After showing that the same principle was in force in the times of Abraham and of David (iv.), he enumerates some of the blessings which faith brings in its train: as, peace (v. 1), patience, experience, hope, and eternal life (2–21). Nor does the doctrine of free grace encourage its recipients to carelessness of moral practice. Paul and other believers are dead to sin, and are spiritual men continually in conflict with it (vi., vii., viii. 1–15). Led by the Spirit of God, admitted to the privileges of sonship, aided in prayer by the Spirit of God, they shall never be separated from the love of Christ, and through him shall be more than conquerors (16–39). The doctrine of the Divine sovereignty is next treated of with respect to nations and individuals, passionate desire being expressed for the salvation, ultimately to take place, of the Jewish people (ix.–xi.). Then follow practical exhortations with respect to Christian conduct in the several relations of life—as to friends, to enemies and persecutors, to the Roman civil authorities, to the church in general, and to weaker brethren in particular (xii.–xv. 13). After intimating more minutely than before his own intended movements (14–33), and sending many salutations from himself and his companions (xvi. 1–23.), he closes with a benediction (24–27). No eminent critic has disputed the genuineness of the epistle, which is acknowledged even by Baur. It is first alluded to by Clement of Rome, A.D. 95, by Ignatius, by Polycarp, by various Gnostics, by Justin Martyr, by the writer of the epistle to Diognetus, &c., till finally Irenæus, about 185, refers to it by name. [Pauline Theology.]

Roman-alum, *s.* An alum extracted from the volcanic rocks of the solfaterra near Naples, and containing more alumina than the common alum.

Roman-architecture, *s. Arch.:* The Composite order. During the first centuries of the Roman state the buildings erected are to be ascribed to the Etruscans, Etruscan art forming the basis of Roman architecture; subsequently, in the time of the Scipios, the taste for Grecian art was mingled with it. Greek architects were soon introduced into Italy; and thus Roman architecture, like Roman art in general, conformed as nearly to the Grecian as the Roman genius permitted it to do. The reticulated masonry [Opus-reticulatum] is peculiar to Roman architecture. It consists of square cuneiform stones or tiles, with the broad ends facing outwards, and arranged in lines, which do not run horizontally, but intersect each other like

net-work. The base and the corners of these walls consist of horizontal layers of square-stone, and there are sometimes intersecting belts of the same kind of material in the middle of the network itself. Amongst all the forms which the Romans borrowed from foreign sources, the art of vaulting, which they learnt from the Etruscans, was that which they most skilfully adapted and developed, and rendered the most distinctive expression of the peculiarity of their own style. Two modes of construction consequently appear side by side in Roman architecture, viz., the Italian arch and the Grecian column.

Roman Catholic, *a. & s.*

A. *As adj.:* Of or belonging to the Roman Catholics. [B.]

B. *As substantive:*

1. *Church Hist. (Pl.):* The adherents of the Church which is Roman in its centre and catholic in its circumference. The word Catholic, meaning Universal, was used in early Christian and mediæval times for the great ecclesiastical organization with which the vast mass of Christians were connected. When the Reformation took place, the Protestants refused to admit that the Church which they had left was entitled to call itself Catholic, and prefixed the adjective Roman, whilst its adherents claimed the designation Catholic without any limiting adjective. All admit it to be catholic in the sense of being the largest Church in Christendom, and all other episcopal Churches acknowledge the validity of the orders of its clergy. The number of Roman Catholics in the world has been estimated at 152,000,000, which is far too low; at 213,518,063, at 214,370,000, and at 218,000,000. Taking the second of these estimates, the distribution of Roman Catholics over the world is believed to be: in Europe, 150,684,050; Asia, 8,311,800; Africa, 2,656,205; America, 51,422,566; Australia and the adjacent islands, 443,442, making a total of 213,518,063.

The radical difference between Protestants and Roman Catholics lies in their conception of the Church. The latter hold that the Roman Church is *the* Church of the New Testament, with authority to define articles of faith, and that all bodies not in communion with her are either heretical or schismatic. Protestants' views differ widely—from that of the High Churchman who, while denying the universal jurisdiction of the Pope, admits that as Bishop of Rome he is *primus inter pares*, to that which considers him the Man of Sin and the Antichrist of Scripture. From this fundamental difference all others necessarily follow. Roman Catholics hold the Apostles', the Nicene, and the Athanasian Creeds, Transubstantiation and the sacrifice of the Mass (q.v.), Seven Sacraments [SACRAMENT, *s.*, II. 2.], the necessity of Confession [PENANCE], the existence of a Purgatory (q.v.), the Immaculate Conception of the Virgin Mary, and the Infallibility of the Pope.

Roman-law, *s.* The Civil law; the system of jurisprudence of the ancient Roman Empire.

¶ Roman law, like every other law, originated in custom. Its first great stage of development was reached in the publication by the Decemviri of the Twelve Tables, B.C. 451. These were supplemented rather than superseded under the republic and the empire. Under the former, enactments made in the *Comitia Centuriata* and the *Comitia Tributa*, the *Senatus Consulta*, and the Magisterial Edicts, and, under the latter, the *Imperial Constitutiones* had the force of law. Finally the Justinian Code, A.D. 529, gave symmetry to the whole. The Roman law has more or less affected the legislation of all European countries.

Roman-literature, *s.*

Cicero flourished B.C. 60; Cæsar, 54; Cornelius Nepos, 44; Virgil and Horace, 28; Livy and Ovid, 14. About A.D. 180 the Roman literature began to decline, and by 539 it was in the last stage of decay.

Their nest is about two feet in diameter; eggs four to six in number, bluish-green, blotched with brown. (See extract.)

3. *Bot. :* The radix or descending axis of a plant. The tendency downwards is very powerful. Unlike the symmetrically placed branches of the stem, the ramifications of the roots look irregular as if they arose from any part of the surface. There is in them, however, a certain Rhizotaxis (q.v.). The roots of Dicotyledons are exorhizal, those of Monocotyledons endorhizal, and those of Acotyledons heterorhizal. A root has no perfect bark, true pith, medullary sheath, or true leaves, and only a thin epidermis, a few stomata, and very rarely leaf-buds. Its growth is chiefly at the lower extremity. The body of a root is called the caudex, its minute subdivisions the fibrils or radicles, and their

ends the spongioles. A primary root is one formed by the downward elongation of the axis of the embryo, and is, therefore, in a line with the stem; secondary or lateral roots, like those of ivy, spring laterally from the stem and from the primary root. When the primary root is thicker than the branches which proceed from it, it is called a tap root, when it is no thicker than its ramifications, which conceal it from view, the root is said to be fibrous. Other forms of roots are conical, fusiform, napiform, rotund, nodose or coralline, moniliform, tuberose, or (finally) premorse. Most roots are terrestrial, a few are aërial, and a few aquatic. The chief functions of the root are to anchor the plant firmly in the ground, and to transmit upwards to the stem and leaves absorbed nutriment from the soil. Roots require air, and in some cases in gardens obtain it by pushing their way into old drains.

The wild rose occurs in Europe, Asia, and Africa, and in America throughout the United States and as far south as Mexico. It is of such diversity that former botanists made more than 200 species. These are reduced by some writers to less than a fifth of that number. [ROSE.]

Bot.: Roseworts; an order of plants placed by Lindley under his Rosal Alliance. Herbaceous plants or shrubs. The Rosaceæ are closely akin to the Pomaceæ, the Drupaceæ, the Sanguisorbeæ, and some other orders. They are divided by Lindley into five families or tribes, Rosidæ, Potentillidæ, Spiræidæ, Quillaiæ, and Neuradeæ. The Rosaceæ occur chiefly in the temperate and cold parts of the northern hemisphere; when they occur in the tropics it is generally on high land. There is no unwholesome plant in the order. They are in general astringent, and have been regarded as febrifuges. [For details, see Agrimonia, Brayera, Fragaria, Geum, Gillenia, Potentilla, Rosa, Rubus, Spiræa, and Tormentilla.] In 1846 Lindley enumerated thirty-eight genera and estimated the known species at 500. Sir Joseph Hooker, in 1870, considered the genera to be seventy-one and the species 1,000, but he includes Lindley's Pomaceæ and Drupaceæ.

A red dye, occurring in commerce under the names aniline red, azaleine, fuchsine, magenta, roseine, &c. It is prepared by heating a mixture of dry arsenic acid and aniline to 140°, for six or eight hours. It forms colourless crystalline plates, which are coloured red on exposure to the air, insoluble in water, but soluble in alcohol. The aniline reds used in dyeing are generally monoacid salts of rosaniline more or less pure. Rosaniline acetate, $C_{20}H_{19}N_3\cdot C_2H_4O_2$, chiefly used in England, forms beautiful large crystals, which are more soluble in water than the other salts. Rosaniline hydrochloride, $C_{20}H_{19}N_3\cdot HCl$, prepared in France and Germany, crystallizes in golden-green rhombic octahedra, and is very soluble in alcohol, with a fine red colour.

II. *Technically:*

1. *Compar. Relig.:* A string of beads by means of which account is kept of the number of prayers uttered. Tylor (*loc. inf. cit.*) thinks that its invention or adoption was due to the fact that, with advancing civilization, prayers, from being at first utterances as free and flexible as requests to a living patriarch or chief, stiffened into traditional formulas, whose repetition required verbal accuracy, and whose nature practically assimilated more or less to that of charms.

"This devotional calculating-machine is of Asiatic invention; it had, if not its origin, at least its special development among the ancient Buddhists, and its jes beds still slide through the modern Buddhist's hands as of old answering out the sacred formulas whose reiteration occupies so large a fraction of a pious life. It was not till towards the middle ages that the *rosary* passed into Mohammedan and Christian lands, and binding there conceptions of prayer which it was suited to accompany, has flourished ever since."—*Tylor: Prim. Cult.* (ed. 1873), ii. 372.

2. *Roman Church:*

(1) A form of prayer in which the *Hail Mary* (q.v.) is recited 150 times in honour of the Virgin Mary. It is divided into fifteen decades, each of which begins with the *Our Father* [Lord's Prayer], is accompanied by meditation on one of the Mysteries in the life of Our Lord, and ends with the Doxology. This is properly called the Dominican, or Great Rosary, but the name is often popularly given to the Chaplet, which contains but fifty Aves. The fifteen Mysteries which should be meditated on during the recitation of the Rosary are divided into three series, each corresponding to a chaplet:

1. Joyful.—The Annunciation, The Visitation, The Birth of Jesus, The Presentation in the Temple, The Finding in the Temple.
2. Sorrowful.—The Agony in the Garden, the Scourging at the Pillar, the Crowning with Thorns, the Carrying of the Cross, the Crucifixion.
3. Glorious.—The Resurrection, the Ascension, the Descent of the Holy Ghost, the Assumption, and the Coronation of the B. V. M.

There are also the Rosaries of St. Bridget, of the Seven Dolours, of the Immaculate Conception, of the Five Wounds, and the Crown of Our Saviour.

Analyses made by Genth and Roscoe, on material more or less impure through mechanical admixtures, indicate that it is a vanado-silicate of alumina and potash, the vanadic acid present varying from 20·5 to over 28 per cent. Found intimately associated with native gold in California.

II. *Technically:*

1. *Arch.:* The same as Rosette (q.v.).

2. *Botany:*

(1) The common English name of the genus Rosa (q.v.). The ordinary dog-rose or brier-rose (*R. canina*) is very common; the trailing dog-rose (*R. arvensis*) much less so. It is sometimes confounded with the Ayrshire rose [see below], which is not wild. The true sweet-brier (*R. rubiginosa*) and the small-flowered sweet-brier are found chiefly in the south of England, especially on chalk. The villous rose (*R. villosa*) is widely distributed, whilst the burnet-leaved or Scotch rose (*R. spinosissima*) flourishes best near the sea. Among the garden-species may be mentioned the Ayrshire rose (*R. cupreolata*) [see above]; the Bourbon rose, a var. of *R. indica*; the cabbage-rose (*R. centifolia*), the Chinese rose (*R. indica*) [see No. 2]; the Damask rose (*R. damascena*), the fairy-rose (*R. A. *As adj.:* Of, or belonging to Rosenkreuz or the society which he is said to have founded.

B. *As subst.* (*Pl.*): A mystic secret society which became known to the public early in the seventeenth century, and was alleged to have been founded by a German noble called Christian Rosenkreuz, A.D. 1388. He was said to have died at the age of 106. The society consisted of adepts, who perpetuated it by initiating other adepts. It did not interfere with religion or politics, but sought after true philosophy. The Rosicrucians pretended to be able to transmute metals, to prolong life, and to know what was passing in distant places. Many contradictory hypotheses have been brought forward regarding the Rosicrucians, and as it is admitted that their secret was never revealed, it is open to doubt if there was one to reveal. They are said to have died out in the eighteenth century. The writer of the article "Rosicrucians" in the *Encyclopædia Britannica* (ed. 9th) believes that the Rosicrucian Society never existed, and that the persons making it known did so simply for a jest. As, however, the public believed in its existence, individuals from time to time declared that they belonged to it. Called also Brothers of the Rosy Cross.

There is no connection with the Latin *rosmarinus* [ROSEMARY]. The confusion seems to have arisen from a passage in Olaus Magnus (ed. 1558, Antv.) "ut rorulento dulcis aquæ gramine vescantur." This appears in a German edition of 1567 (where the animal is called Rossmar) as "dem süssen grasz." Gesner has simply "gramine pascitur." He notes that Germans living on the seaboard call it *rostinger*, that in Moscovy or Scythian Hungary, not far from the source of the Tanais, it is called *morsz*; and that some believe the Mod. Lat. *rosmarus* to be formed from a (M.H.) Ger. *rusóz*, "which seems to have been coined to express the impetus and rushing sound with which the animal moves through the water."]

(From Olaus Magnus, *loc. cit.*)

Zool.: The Walrus (q.v.). At the time Spenser wrote little was known of this animal, but Gesner (*Hist. Anim.*, iv. 249), to whom Spenser is indebted, was sufficiently well informed to point out that the picture given of it in Magnus's book was incorrect, both as to

B. *As substantive:*

1. *Eccles. & Church Hist.* (*Pl.*): A congregation, consisting of priests and laymen, founded by the Abate Antonio Rosmini-Serbati (1797–1855), the members of which are bound "to embrace with all the desire of their souls every work of charity, without arbitrary limitation to any particular branch, undertaking all that should be required of them of which they should be capable." The novitiate lasts two years, and the members take the three vows of poverty, chastity, and obedience, but wear no distinctive habit. Each retains a sort of title to his own property but it is really at the disposal of the general. The Order owns no property. There is an English house for novices at Wadhurst.

"Its members are better known by the shorter name, *Rosminians*."—*T. Davidson: Phil. Syst. of A. Rosmini-Serbati*, p. xlvi

Rŏs-mĭn'-ĭ-an-ĭsm, *s.* [Eng. *Rosminian*; *-ism.*]

Philos.: The system of the Abate Antonio Rosmini-Serbati. His starting-point and central principle was the dictum of St. Thomas Aquinas, that Being (*ens* or *ens commune*) was the object of intelligence and the ground of the principle of contradiction. Rosmini saw that it is the essence of intelligence to have an object, and that that object is Being, and his whole system is merely a working out of the idea of Being into all its ramifications and principles, necessary and contingent. (*Davidson.*)

"The best exposition of *Rosminianism*."—*Ueberweg: Hist. Phil.*, ii. 497.

II. *Technically:*

1. *Agric.:* [¶ (4)].

2. *Astron.:* The turning of a planet round on its imaginary axis, like that of a wheel on its axle. In the infancy of astronomy it was assumed that the earth was at rest, and that the sun and stars moved round it from east to west. After note had been taken of the fact that when a boat is gently gliding along a canal or tranquil lake, the sensation to one on board is as if the boat were stationary, and objects on the bank moved past in the opposite direction, a second hypothesis became worth consideration, viz., that the apparently stationary earth might be like the moving boat, and the heavens resemble the really stationary banks. It gathered strength when it was considered that the earth was not a sphere but an oblate spheroid, as if rapid whirling had bulged it out at the equator, that Jupiter was yet more flattened at the poles than the earth, and that the direction of the trade-winds, cyclones, &c., seemed the result of rotation. In 1851 Foucault completed the proof by making visible to the eye that a pendulum with a very long string alters its direction in a way which cannot be accounted for except by rotation. [GYROSCOPE.] The rotation of the earth is performed with a uniform motion from west to east, and occupies the interval in time which would elapse between the departure of a star from a certain point in the sky and its return to the same point again. The only motions which interfere with its regularity are the Precession of the Equinoxes and Nutation (q.v.). The time taken for rotation of the earth measures the length of its day (q.v.). So with the other planets. The sun also rotates as is shown by the movement of spots across its disc. [SUN.] The earth's rotation slightly increases the force of gravity in moving from the equator to the poles. Sir Wm. Thomson, reasoning from some small anomalies in the moon's motion, inferred that ten millions of years ago the earth rotated one-seventh faster than it does now, and that the centrifugal force then was to that now as 64 to 49.

¶ (1) *Angular velocity of rotation:* [ANGULAR-VELOCITY].

(2) *Axis of rotation:* [AXIS].

(3) *Centre of spontaneous rotation:* [CENTRE, ¶ (35)].

(4) *Rotation of crops:*

Agric.: The cultivation of a different kind of crop each year, for a certain period, to prevent the exhaustion of the soil. If a plant requiring specially alkaline nutriment be planted year after year in the same field or bed, it will ultimately exhaust all the alkalis in the soil and then languish. But if a plant be substituted in large measure requiring siliceous elements for its growth, it can flourish where its alkaline predecessor is starved. Meanwhile the action of the atmosphere is continually reducing to a soluble condition small quantities of soil, thus restoring the lost alkalis. Manure will replace lost elements more quickly. The period of rotation is often made four years. [FOURCOURSE.] By the neglect of rotation soils in parts of Sicily, Asia Minor, Campania, and Spain, which were once highly productive, are now barren.

Wilkins and Wallis, established a scientific club in the metropolis, which maintained a chequered and intermittent existence sometimes in London at others in Oxford, till at length being revived at the Restoration it became the parent of the Royal Society. At a meeting of the club, held Nov. 28, 1660, the formation of a new society was resolved on, and its scope and constitution defined. Its first public action took place on Dec. 5, 1660, and the members, in 1662, obtained a charter, and were incorporated as the Royal Society. Charles II. flattered himself that he was its founder, and among the names of its fellows was that of the Duke of York, afterwards James II. Sir Isaac Newton was elected a fellow in Jan., 1672, admitted in Feb., 1672, and in 1703 became president. The first number of the *Philosophical Transactions*, recording the work of the society, appeared on March 6, 1665. After 1800 the annual volume took the place of occasional numbers. In 1709, a bequest from Sir Godfrey Copley led to the establishment of the Copley gold medal, and a donation from Count Rumford, in 1796, resulted in the foundation of the Rumford gold and silver medals. Two more medals were established by George IV. in 1825. The Linnæan Society branched off from it in 1788, the Geological Society in 1807, and the Royal Astronomical Society in 1820. For a considerable time the number of the members stood at 600; latterly, however, only fifteen members have been annually elected, so that the number of fellows will in a few years be reduced below 500. With the exception of a small Roman Academy, the Royal Society of London was the first of the kind established, the Royal Academy of Science at Paris not having arisen till 1666.

Its salts have a tendency to assume a reddish tint on exposure to the air.

rû'-bĭd, *s.* [Lat. *rubidus* = dark red.]

Chem.: A monad metallic element belonging to the potassium group, discovered by Kirchhoff and Bunsen in 1860. Symbol Rb; atomic weight, 85·4; sp. gr. 1·52. It has been detected in mineral waters, in several lepidolites, and in the ash of many plants, as tobacco, tea, and coffee. It may be obtained from the saline residue in the preparation of lithia from lepidolites, by adding platinic chloride, and dissolving out the potassium compound by repeated boiling with water. The chloroplatinate of rubidium is reduced with hydrogen, and the purified chloride of rubidium, mixed with calcium tartrate and soot, is heated in a furnace, the volatilised metal being collected in a receiver containing mineral naphtha. It is a white metal with silvery lustre, soft to the touch, and melting at 38·5°. Exposed to the air, it becomes covered with a gray film, and soon takes fire. rŭm, *s.* [See extract.]

Comm. : A spirit distilled chiefly in the West Indies from the fermented skimmings of the sugar-boilers and molasses, together with sufficient cane juice to impart the necessary flavor. Like all other spirit, it is colorless as it issues from the still, but to suit the taste of the consumer, the distiller is obliged to color it before it leaves his premises. Its strength as imported is usually about 20 per cent. over proof, but before passing into the hands of the consumer it is reduced with water. Rum sold below 35 per cent. under proof is considered to be adulterated with water, unless the purchaser is informed of its exact strength at the time of purchase. Much of the rum sold in this country is merely plain spirit, colored with burnt sugar, and flavored with rum flavoring. Rum was formerly largely imported from the West Indies.

"Mr. N. Darnell Davis has put forth a derivation of the word *rum*, which gives the only probable history of it. It came from Barbadoes, where the planters first distilled it, somewhere between 1640 and 1645. A MS. *Description of Barbadoes*, in Trinity College, Dublin, written about 1651, says: 'The chief fuddling they make in the island is *rumbullion*, alias Kill-Divil, and this is made of sugar canes distilled, a hot, hellish, and terrible liquor.' G. Warren's *Description of Surinam*, 1661, shows the word in its present short form : '*Rum* is a spirit extracted from the juice of sugar-canes, . . . called Kill-Devil in New England.' '*Rumbullion*' is a Devonshire word, meaning 'a great tumult,' and may have been adopted from some of the Devonshire settlers in Barbadoes; at any rate, little doubt can exist that it has given rise to our word *rum*, and the longer name *rumbowling*, which sailors give to their grog."—*Academy*, Sept. 5, 1885, p. 155.

rû-mĭn-ā'-tion, *s.* [Lat. *ruminatio*, from *ruminatus*, pa. par. of *rumino* = to ruminate (q.v.).]

1. *Lit. & Animal Physiol.:* The act of chewing the cud. The food of the ruminants is grass, which requires a longer series of chemical changes to convert a portion of it into blood, than does the flesh of other animals eaten by the Carnivora. To produce these changes there is a complex stomach divided into four parts, the Rumex or Paunch, the Reticulum or Honeycomb Bag, the Psalterium or Manyplies, and the Abomasum or Reed. A ruminant does not chew the fodder which it eats, but simply swallows it. When it has had enough it retires to a quiet spot, forces up again to the mouth a portion of the food in its paunch, thoroughly chews it and then swallows it again. Another and another bolus is thus disposed of. Each of these, started from the paunch, was forced next into the honeycomb bag where it received its form and then went up the gullet. On returning it passed direct from the paunch into the manyplies or third stomach, and then to the abomasum.

Archæology:

1. Any letter of the Futhork (q.v.). They are formed almost entirely of straight lines, and may have been derived, as Schlegel supposes, from the Phœnicians, for several of the Runic characters bear close resemblance to the letters of the Phœnician alphabet. Schloezer holds that they are corruptions of the Roman alphabet, whilst another theory is that they are the original characters of the Indo-Germanic tribes brought from the East, and preserved among the races of that stock. The name Rune was first mentioned by Venantius Fortunatus in the sixth century as the name of a German letter. The knowledge of the Runes was confined to a small class, and they were used for purposes of augury, and for magical symbols. They have been grouped into three systems—the Anglo-Saxon, the German, and the Norse or Scandinavian; but no great difference exists between them. Traces of Runes in inscriptions occur in England in the old kingdoms of Northumbria, Mercia, and East Anglia; in Denmark, Norway, Sweden, Germany, and Iceland. The so-called Runes of North America are nothing more than Indian picture-writing.

Next year (1876) the appreciation of gold began or became perceptible with the corresponding depreciation of silver. Tested by a gold standard the Madras rupee steadily fell, and in 1886 was worth about 1s. 6d. only. As the Indian government receiving taxes in silver, has to pay home charges in gold or its full equivalent, it lost, in 1876–7, a little over two millions of pounds sterling, and in 1882–3 more than three millions. (*W. W. Hunter: Indian Empire, Statesman's Year Book, &c.*)

Church Hist. & Eccles.: The church established in Russia. It is an offshoot from the Greek church, the conversion of the Russians to Christianity having been effected by Greek missionaries. About A.D. 900, a metropolitan was consecrated at Constantinople for the see of Kiew, the capital of a Grand Duke. In 955 the Russian princess Olga went to Constantinople to be baptised. In 988 Vladimir the Great was also baptised, married the sister of the Greek emperor, and took active steps to spread Christianity in his dominions. In 1223 the Mongol Tartars invaded the country, and destroyed Kiew in 1240. In 1299, the seat of the metropolitan see was removed to Vladimir, and subsequently to Moscow. In 1415 a separation took place between the Russian and Polish churches. In 1702, Peter the Great swept away the dignity of the patriarch and proclaimed himself head of the Church. A Holy Synod was constituted to counsel and assist him in his government. The tenets of the Russian Church are essentially those of the parent Greek Church (q.v.). There are many dissenters.

¶ *The Book of Ruth:*

Old Test. Canon: A short book now placed in the Hebrew Bible in the Hagiographa, between the Song of Solomon and the Lamentations. The English Bible, following the Septuagint and the Vulgate, arranges it between the books of Judges and Samuel. During the times of the Judges, a certain Elimelech, of Bethlehem-Judah, *i.e.*, of Bethlehem in Judah, as distinguished from Beth-le-hem in Zebulun (Josh. xix. 15), to escape a famine then raging, went to Moab with his wife, Naomi, and his two sons, Mahlon and Chilion, who married two Moabitesses, Orpah and Ruth. There all the male members of the family died, and the widowed Naomi, hearing that the famine was over, thought of returning home. Orpah, after starting with her, was prevailed on to return; Ruth, the heroine of the narrative, could not be persuaded to go back, and having, after reaching Bethlehem, gone into the fields as a gleaner, she attracted the notice of Boaz, an aged kinsman, with whom she made a romantic marriage, ultimately becoming the great-grandmother of King David, and an ancestress of Jesus Christ (Matt. i. 5). The Book of Ruth is a beautiful idyllic composition. It was penned not earlier than the time of David (ch. iv. 22), and probably much later, for there had been time for customs existent in the days of Boaz and Ruth to change (7). The narrative is in pure Hebrew, but there are Aramæanisms in the dialogues. Most critics place its composition before, but Ewald during, the Exile. Its canonicity has never been doubted.

rû-thē'-nĭ-ŭm, *s.* [See extract.]

"In 1828 Osann stated that he had discovered three new metals in the platinum ores from the Ural. To one of these he gave the name of *ruthenium*, from the name of Russia."—*H. E. Roscoe : Treat. on Chemistry*, ii. (pt. ii.), 449.

Chem. : A tetrad metallic element discovered by Osann in 1828, and first isolated by Claus in 1846. Symbol, Ru. Atomic weight 104. It occurs in platinum ores, chiefly in osmiridium, and is separated from the latter by heating to redness a mixture of this ore and common salt in a current of moist chlorine. By digestion in cold water an extract is obtained from which ammonia throws down the oxides of ruthenium and osmium. The latter is expelled by heat, and the former converted into ruthenate of potassium by fusion with potash, which yields oxide of ruthenium on addition of nitric acid. On ignition in a stream of hydrogen the oxide is reduced to the metallic state in the form of porous fragments. With the exception of osmium it is the most refractory of all metals, but can be fused in the hottest part of the oxyhydrogen blow-pipe. It then has a density of 11 to 11·4, and is scarcely attacked by nitro-muriatic acid.

ruthenium-chlorides, *s. pl.*

Chem. : Ruthenium forms three chlorides: (1) Dichloride, $RuCl_2$; produced when powdered ruthenium is ignited in a stream of chlorine. It remains as a black crystalline powder, insoluble in water and in all acids. (2) Trichloride, $RuCl_3$; prepared by dissolving in hydrochloric acid the black precipitate obtained from ruthenate of potassium by addition of an acid. It is a yellow-brown crystalline mass, easily soluble in water and alcohol. With sulphocyanide of the alkalis it yields a red coloration, changing to deep violet on heating. (3) Tetrachloride, $RuCl_4$; known only in combination in its double salts, *e.g.*, K_2RuCl_6, which crystallizes in regular transparent octahedrons.

ruthenium-oxides, *s. pl.*

Chem. : Ruthenium forms five oxides: (1) Protoxide, RuO, obtained by calcination of the dichloride, has a dark-gray colour, and is not acted on by acids. (2) Sesquioxide, or ruthenious oxide, Ru_2O_3, produced when pulverised ruthenium is heated in contact with the air, has a deep blue colour, and is insoluble in acids. (3) Dioxide, or ruthenic oxide, RuO_2, formed by roasting the disulphide. It is a black-blue powder with a tinge of green. (4) Trioxide, RuO_3, commonly called ruthenic acid, is known in combination with potash, and is produced when ruthenium is fused with potash and nitrate of potassium. (5) Tetroxide, RuO_4, produced by passing chlorine into a solution of the fused mass obtained by heating ruthenium with potash and nitre. This volatile oxide passes over and condenses on the neck of the retort. It is golden-yellow and crystalline, volatilizes at ordinary temperatures, melts at 58°, boils at 100°, and is heavier than sulphuric acid. Is sparingly soluble in water.

S.

S, the nineteenth letter and the fifteenth consonant of the English Alphabet, represents a hissing sound, and is classed as a sibilant. "In pronouncing *s*, we touch the gum with a part of the tongue just above that part which is used in pronouncing the palatals; but we touch the gum so lightly, and with the tongue so broadened out that we do not stop the outward flow of the breath completely: it oozes forth with that hissing sound which, whether in the human organ or in any other machine, invariably results from the rapid flow of air through a contracted passage." (*Beames: Comp. Gram. Aryan Lang.* (ed. 1872), i. 217). There are two sounds attached to this letter in English; the one surd, or uttered with breath merely, the other sonant or voiced. The first is a mere hissing sound, as in *sin, so,* &c.; the other is exactly the same as that of *z*, as in *music, muse,* &c. *S* in some words, as *isle, island, viscount,* is silent. It is closely allied to *r*, and even in the oldest English we have traces of the interchange, as in *frore* = *froren* = *frosen* (*frozen*), *gecoren* = *chosen,* &c. *S* has become *st* in *hoist* = *hoise, whilst* = *whiles,* &c. It has been changed into *c*, as in *mice* = O. Eng. *mys, once* = O. Eng. *ones, hence* = O. Eng. *hennes,* &c. With a following *h* it forms a digraph, a weakening of an older and stronger sound *sc*, as *shall* = O. Eng. *sceal, fish* = O. Eng. *fisc,* &c. It has been changed into *ge*, as in *cabbage* = Fr. *cabus;* Lat. *cabusia: sausage* = Fr. *saucisse;* Lat. *salsisia.* In *pickaxe,* owing to a mistaken etymology, it has become *x*. In Romance words *s* has passed into *sh*, as *radish* = Lat. *radix; cash* = Fr. *casse, chasse* = Lat. *capsa.* From some words it has disappeared as in *pea* = O. Eng. *pise* = Lat. *pisum; hautboy* = Fr. *hautbois; puny* = Fr. *puisne,* &c. In a few words we find an intruded *s*, as in *island* = O. Eng. *ealand, igland, aisle* = Fr. *aile; squeeze, sneeze, scratch, smelt,* &c. It is represented by *z* in *dizzy* = O. Eng. *dysig; freeze* = O. Eng. *freosan.* In O. Eng. *sc* and *sp* were frequently transposed to *cs* and *ps*, as in *ask* = O. Eng. *axian, clasped* = *clapsed. S* is an exceedingly common letter in English. It is the characteristic sign of the genitive case and plurals of nouns.

S. As an initial is used for South, as in S.W. = South-West; for Society, as F.R.S. = Fellow of the Royal Society; for Saint, or double (SS.) for Saints.

S. As a symbol is used:

1. As a numeral for 7, and with a dash over it, $\bar{S}$, for 7,000.

2. In chemistry for the element Sulphur.

B. *As substantive:*

* **1.** In the sixteenth century, one who considered that the Christian Sabbath should be kept on the seventh day (Saturday). [SEVENTH-DAY BAPTISTS.]

"This term designates a very small sect in the 17th and 18th centuries, who insisted strictly on keeping the seventh day as their Sabbath, according to the letter of the divine injunction. It is only by a modern misuse of the word that a *Sabbatarian* is understood to be one who abjures all work on Sunday."—*Daily Telegraph,* Dec. 19, 1885.

2. One who holds that the Lord's day is to be observed among Christians in exactly the same manner as the Jews were enjoined to keep the Sabbath; one who holds rigid views of Sabbath observance. The *Shorter Catechism* (Q. 60) says:

"The Sabbath is to be sanctified by a holy resting all that day even from such worldly employments and recreations as are lawful on other days; and spending the whole time in the publick and private exercises of God's worship, except so much as is to be taken up in the work of necessity and mercy."

Sabbatarian Controversy, *s.*

Church Hist.: A controversy regarding the manner in which Sunday should be kept, arising out of the publication of King James's *Book of Sports* [SPORT, *s.*], published in 1618, between the High Churchmen, who were generally in favour of the king's views, and the Puritans, who very strongly opposed them. Though the controversy has altered its form, and access to museums, libraries, and picture-galleries is now contended for, it has not yet reached its end.

Săb-bą-tā′-tī, *s. pl.* [INSABBATATI.]

Săb′-bąth, *s. & a.* [Heb. שַׁבָּת (*shabbath*) = Sabbath, from שָׁבַת (*shabath*) = to rest.]

A. *As substantive:*

1. *Old Test.:* A sacred day of rest, the institution of which is first mentioned in Gen. ii. 2-3:

"And on the seventh day God finished his work which he had made: and he rested on the seventh day from all his work which he had made. And God blessed the seventh day and hallowed it; because that on it he rested from all his work which God had created and made."—*A.V.*

The prevailing interpretation of these verses is that the Sabbath was instituted at the Creation for mankind in general, and that septenary institutions (q.v.) may therefore be expected in all nations. Prior to the giving of the law from Mount Sinai, the Sabbath is mentioned in connection with the descent of manna (Exod. xvi. 5, 22-30). The keeping holy of the Sabbath is enjoined in the fourth commandment in Exodus, because of God's having rested after the Creation (Exod. xx. 8-11); in Deut. because of the deliverance of the Hebrew bondsmen

from Egypt (Deut. v. 12–15). Two lambs instead of one were offered when it came (cf. Num. xxviii. 3–4 with ver. 9). Isaiah (lvi. 2, lviii. 13) strongly advocated its observance. [SABBATH-BREAKING.]

2. *New Test.:* Always in the gospels, and as a rule in the other books, Sabbath means the seventh day of the week. By this time its observance had become very rigid and punctilious, and Jesus himself was constantly denounced by the Pharisees and others as a Sabbath-breaker (Matt. xii. 1–2; Mark ii. 2–3, &c.). In self-defence he laid down this principle: "The Sabbath was made for man, and not man for the Sabbath: therefore the Son of Man is Lord also of the Sabbath" (cf. Matt. xii. 8 with Mark ii. 28). In the epistles the keeping of the Jewish Sabbath is left optional with Christians (Col. ii. 16–17); the day for them is the Lord's day (q.v.) (Rev. i. 10).

3. *Theol. & Church Hist.:* For the first three centuries the Christian fathers in general drew a distinction between the Sabbath and the Sunday or Lord's day, regarding the former as Jewish and obsolete, and the latter as a divinely instituted day, joyous in its character as commemorating Christ's resurrection. But from the days of the first and ambiguous edict of Constantine on the subject:

"Let all judges, inhabitants of the cities, and artificers, rest on the venerable Sunday [dies solis]. But husbandmen may freely and at their pleasure apply to the business of agriculture,"

there was an increasing tendency to transfer to the Sunday and, in a less degree, to saints' days and minor festivals the restrictions of the Jewish Sabbath. The third Council of Orleans (A.D. 538) strove to check this tendency, but in the same century we find legends of miraculous judgments on those who worked on the Sunday (*Migne: Patrol.*, lxxii. 61). The idea of the "Christian Sabbath" seems to be enunciated for the first time in Alcuin (*Homil.* xviii. *post Pent.*). Smith (*Christ. Antiq.*, ii. 1,052) says "that the general teaching of the schoolmen follows the express declaration of Aquinas, 'that the observance of the Lord's Day in the New Law supersedes the observance of the Sabbath, not by obligation of the (divine) law, but by the ordinance of the Church and the custom of the Christian people.'" The Reformers generally were opposed to Sabbatarian views, which, however, more or less modified, have found a place in Protestant churches generally, and reached their height in the Puritan period. Sabbath observance is stricter in Scotland than in England, and in England than on the Continent. (For the practice of many Londoners in Byron's time see *Childe Harold*, i., lxix., lxx.) [SABBATARIAN CONTROVERSY.]

¶ In the middle ages Sabbath meant only Saturday. According to the elder Disraeli, it was first used in England for Sunday in 1554.

Sabbath-breaker, *s.* One who breaks, violates, or profanes the Sabbath by neglecting the religious observance of that day.

"The usurer is the greatest *sabbath-breaker*, because his plough goeth every Sunday."—*Bacon: Essays.*

Sabbath-breaking, *s. & a.*

A. *As subst.:* The act of breaking, profaning, or violating the Sabbath—

1. *Jewish times:* Moses, by the divine command, punished with death a man who gathered sticks on the Sabbath (Num. xv. 32–36). Nehemiah put an end to secular work among the Jews and the heathen Tyrians who came to traffic at Jerusalem (Neh. xiii. 15–22).

2. *Christian times:* The edict of Constantine [SABBATH] of course carried with it penalties on those who disregarded it. Legislation in favour of the Sabbath naturally followed in most Christian countries. In England, statutes on the subject were passed under Athelstan, Henry VI., Charles I., &c. By the statute 29 Chas. II. c. 7., still in force:

"No person is allowed to work on the Lord's day, or use any boat or barge, or expose any goods to sale, except meat in public houses, milk at certain hours, and works of necessity or charity, on forfeiture of 5s. Nor shall any drover, carrier, or the like travel upon that day, under pain of 20s."

The laws of colonial New England, enacted by the Puritans, and ordinarily known as the "blue laws," contained severe and stringent measures against Sabbath-breaking. Though these edicts have become obsolete, laws passed in the last century remain on the statute books of several of the states, and are occasionally revived, to the annoyance of the Americans of to-day.

"Profanation of the Lord's day, vulgarly (but improperly) called *sabbath-breaking*."—*Blackstone: Comment.*, bk. i., ch. 4.

B. *As adj.:* Breaking, or given to breaking the Sabbath.

Sa-bĕl'-lĭ an-ĭsm, *s.* [Eng. *Sabellian; -ism.*]

Church Hist.: The name given to any form of doctrine which denies a real distinction between the Persons of the Trinity:

1. Patripassianism (q.v.).

2. The doctrine of the adherents of Sabellius (an African presbyter of the third century), if not of Sabellius himself. It resolved the doctrine of the Trinity into three manifestations of God to man, and taught that the same Person was the Holy Ghost when manifesting himself to the Christian Church, and, by parity of reasoning, the Son, when he appeared in Christ. Thus Patripassianism was avoided, but the Incarnation, as well as the Trinity, was denied, for the manifestation of God in Christ could differ only in degree, not in kind, from his union with other holy men. Akin to this teaching was that of Marcellus (bishop of Ancyra in the early part of the fourth century), who made the Logos a mere attribute of God, manifesting itself in the Creation, the Incarnation, and the sanctification of Christians.

2. In the same sense as II.

*3. A sacred token or pledge; the pledge of a covenant.

"This worde *sacrament* is as much to say as an holy signe, and representeth alway some promise of God."—*Tyndall: Works*, p. 148.

II. *Technically:*

1. *Protestant Theol.:* The Church Catechism defines a sacrament as "an outward and visible sign of an inward and spiritual grace given unto us, ordained by Christ himself, as a means whereby we receive the same, and a pledge to assure us thereof." It recognizes two only as generally necessary to salvation, Baptism, and the Supper of the Lord. Article xxv. says that they were ordained by Christ not only to be badges or tokens of Christian men's profession, but also, or rather, to be sure signs of grace and God's good will towards us, by which he strengthens our faith in him. They have a wholesome effect or operation only to those who worthily receive them; unworthy recipients purchase to themselves damnation [Cf. 1 Cor. xi. 29. The R.V. has "judgement"]. The Westminster Confession of Faith teaches essentially the same doctrine. It considers sacraments to be "holy signs and seals of the covenant of grace" (ch. xxvii.).

2. *Roman Theol.:* A visible sign, instituted by Christ, which confers *ex opere operato* sanctifying grace on man. [Opus Operatum.] Matter, form, and a minister acting with the intention of doing what the Church does are necessary to the valid administration of a sacrament. Besides sanctifying grace, sacraments confer sacramental grace—that is, they aid the suscipient in a special manner to attain the end for which each sacrament was instituted. (*Gury: Tract. de Sac. in Genere.*) The Council of Trent (sess. vii., can. 1) defines that the Sacraments of the New Law were instituted by Our Lord, and are neither more nor fewer than seven in number: Baptism, Confirmation, Eucharist, Penance, Extreme Unction, Holy Orders, and Matrimony. The first five are necessary for all Christians, the last two are necessary only for the community. Baptism, Confirmation, and Order imprint a character on their subject, and cannot be repeated without sacrilege. The term Sacraments of the Old Law has been adopted to signify circumcision, the paschal lamb, the ordination of priests and Levites, &c., of the Mosaic economy. St. Augustine (*adv. Julian.*, v. 11) was of opinion that some

remedy for original sin must have existed prior to the institution of circumcision, and to this the name of Sacrament of Nature is often given.

3. *Law:* By 1 Edw. VI., c. 1, 1 Eliz., c. 2, and 9 & 10 Wm. III., c. 32, any one reviling the sacrament of the Lord's supper was to be punished by fine and imprisonment.

I. *Ordinary Language:*

(2) That which is so devoted, surrendered, or abandoned.

(3) The selling or disposing of goods at a value under cost price: as, To sell one's stock at a *sacrifice.*

II. *Technically:*

1. *Compar. Relig.*: Sacrifices form an important part of all early forms of religion. Tylor (*Prim. Cult.*, ch. xviii.) traces three stages in the development of the rite. (1) The gift-theory, in which the deity takes and values the offering for himself; (2) the homage-theory, in which the submission or gratitude of the offerer is expressed by a gift; and (3) the abnegation-theory, in which the worshipper deprives himself of something prized. With regard to their nature, sacrifices are divided into (1) Bloody [(*a*) human; (*b*) of the lower animals], and (2) Unbloody. The terrible custom of offering human sacrifices was very widely spread [See extracts]. It was known among the Greeks (*Il.* iv. 35, xviii. 336, xxi. 28; *Eurip., Iphig.*) and the Romans (*Dio Cas., Hist. Rom.*, xliii. 24); and is frequently mentioned in Scripture (cf. Gen. xxii. 1–4, Judges xi. 29–40, 2 Kings iii. 27, xvii. 31, xxi. 6, xxiii. 10, 2 Chron. xxviii. 3, xxxiii. 6, Jer. vii. 31, 32, xix. 5, 6, Ezek. xvi. 21, xx. 31, Mic. vi. 7. See also *Kalisch: Levit.*, pt. i., pp. 381 sqq). Stanley (*Jewish Church*, i. 40) says:

"On the altars of Moab, and of Phœnicia, and of the distant Canaanite settlements in Carthage and in Spain, may even, at times, within the confines of the Chosen People itself, in the wild vow of Jephthah, in the *sacrifice* of Saul's sons at Gibeah, in the dark *sacrifices* of Hinnom, under the very walls of Jerusalem—this almost irrepressible tendency of the burning zeal of a primitive race found its terrible expression."

As civilization advanced, human victims were replaced by symbols (*Ovid: Fasti*, v. 665–660), or oxen or sheep were offered in their stead. Unbloody sacrifices consisted of libations, incense, fruit, and cakes (often in the form of, and as substitutes for, real animals). It is noteworthy that though the first sacrifice mentioned in the Old Testament (Gen. iv. 3) belonged to this category, the first sacrifice accepted (Gen. iv. 4) was a bloody one.

"The custom of sacrificing human life to the gods arose undoubtedly from the belief, which under different forms has manifested itself at all times and in all nations, that the nobler the *sacrifice* and the dearer to its possessor, the more pleasing it would be to the gods."—*Smith: Dict. Antiq.*, p. 990.

2. *Old Test.*: Sacrifices were of two kinds, bloody and unbloody. Those designed to atone for sin were of the former kind (Lev. i.–vii.; cf. Heb. ix. 22). The idea of sacrifice first appears in Gen. iv. 3–5, and viii. 20, but the English word sacrifice does not occur in the A.V. till xxxi. 54. The paschal lamb is called a sacrifice (Exod. xxxiv. 25; Deut. xvi. 2). Even from patriarchal times sacrifices were limited to clean beasts and birds, and were offered on an altar (Gen. viii. 20). Many of these sacrifices were made by fire. [BURNT-OFFERING.] A certain portion of the slain animal was reserved for the priest (Deut. xviii. 3). Under the law there were morning and evening sacrifices (1 Kings xviii. 29; Ezra ix. 4, 5; Dan. viii. 11, 12, 13; xii. 11), besides weekly sacrifices on the Sabbath, sacrifices at new moons, annual ones, &c. Not merely were there stated sacrifices for the people at large, arrangements were at times made that private families also should possess the boon (1 Sam. xx. 6, 20). Under the Monarchy sacrifices were confined to the temple at Jerusalem (2 Chron. vii. 12). Thanksgiving was called a sacrifice (Lev. vii. 12, 13; Psalm cvii. 22; cxvi. 17; Jonah ii. 9), so was praise (Jer. xxxiii. 11). Ultimately sacrifice, having hardened into a ceremony with little influence on moral conduct, is itself disparaged (Psalm xl. 6; Hosea vi. 6), and preference is accorded to obedience (1 Sam. xv. 22) justice or righteousness (Prov. xxi. 3) and mercy (Hosea vi. 6).

3. *New Test.*: Abel's offering is now called a sacrifice, and its excellence is made to arise from the faith with which it was offered (Heb. xi. 4). The frequent repetition of the sacrifices under the law is adduced as evidence of their failure to remove sin (Heb. vii. 27; x. 1–9). Jesus is at once the sacrificing high priest (Heb vii. 12) and the victim sacrificed (ix. 26). To love the Lord is declared by Jesus to be more than all sacrifice (Mark xii. 33), and thanksgiving and praise (Heb. xiii. 15) are again ranked as sacrifices.

4. *Theol.*: The evangelical doctrine is that the sacrifices of the older economy were types and shadows of the atoning sacrifice made by Christ. For instance the lamb offered by Abel typified the Lamb of God (John i. 29), the devotion of the lamb to death implied a confession on the part of Abel that he was sinful, and deserved to die, coupled with a hope that the substitution of the innocent lamb for the guilty offerer would be permitted. It is held that when Jesus died his sacrifice once for all satisfied Divine justice, and no other was requisite, or would, if offered, be accepted (Heb. ix. 12, 25–28, x. 10, 12, 14).

II. *Judaism (Pl.):* One of the three Jewish sects. The current tradition, which was first published by Rabbi Nathan in the second century, is that the Sadducees derived their name from a certain Zadok, a disciple of Antigonus of Soko (B.C. 200–170). In the opinion of Geiger and others, the Zadok from whom they derive their name was the priest who declared in favour of Solomon when the High Priest Abiathar adhered to Adonijah (1 Kings i. 32–45). His descendants had a subsequent preeminence (Ezek. xl. 46, xliii. 19, xliv. 15, xlviii. 11). Not that the Sadducees became a party so early, or that Zadok was their founder; but that some of them may have been his descendants, and all admired his fidelity to the theocratic government, even when the head of the priesthood had gone astray. It was their desire to be equally faithful. All the Jews admitted that the Mosaic law was given at Sinai by Jehovah himself. Most of the people, with the concurrence and support of the Pharisees, believed that an oral law of Moses had similarly come from God. The Sadducees rejected this view, and would accept nothing beyond the written word. They were the Protestants of the older economy. Certain consequences followed. In the Mosaic law there is no reference to a state of rewards and punishments in a future world. When Jesus proves the resurrection from the Pentateuch, he does so by an inference, there being no direct passage which he can quote (Matt. xxii. 31, 32). The Sadducees therefore denied the resurrection from the dead (verse 23). The doctrine of a future world is taught in some passages of the Old Testament, spec. in Dan. xiv. 2, 3, &c., which should have modified their belief. That it did not do so can be explained only by supposing that they attributed a higher inspiration to the Mosaic law than to other parts of the Old Testament. Epiphanius (*Hæres.*, xiv.) and some other of the fathers assert that the Sadducees rejected all the Old Testament but the Pentateuch. Probably, however, these writers confounded the Sadducees with the Samaritans. In Acts xxiii. 8, it is stated that they say that "there is neither angel nor spirit." How they could ignore all the angelic appearances in the Pentateuch (Gen. xvi. 7, 11, xix. 1, &c.), is hard to understand. Perhaps they may have believed that, though angelic appearances once took place, they had now ceased. It is surprising that a sect with these views should, at least at one time, have almost monopolised the highest places in the priesthood; yet such was the case at least temporarily (Acts iv. 1–6). But, with all their sacred office and worldly rank, they could have had no hold on the common people. It is probable that, when Christianity spread—even among its Jewish opponents—a belief in the resurrection, the Sadducees must have still further lost ground; but they ultimately revived, and still exist, under the name of Karaites (q.v.).

Their numbers are few, and they are found chiefly in Furruckabad, Delhi, Mirzapore, &c. (*Rev. Mr. Fisher, Mr. Trant*, &c.)

safety-hook, *s.* A device to prevent a watch from being detached from its chain by accident or by a sudden jerk.

safety-lamp, *s.* A lamp for the purpose of giving light in mines where fire-damp prevails. The commonest form is that invented by Sir H. Davy, in 1816. The principle of his lamp lies in the fact that flame will not pass through a fine net-work of wire or gauze. The flame of the lamp is enveloped by a cylinder of wire-gauze, the apertures in which must not exceed $\frac{1}{28}$ of an inch square, through which the air passes freely, even if charged with fire-damp. When the lamp is lighted and introduced into an atmosphere mixed with fire-damp, the size and length of the flame are first increased. When the inflammable gas becomes as much as one-twelfth of the volume of air, the cylinder becomes filled with a feeble blue flame, within which the flame of the wick burns brightly; its light continues till the fire-damp increases to one-sixth, or one-fifth, when it is lost in the flame of the fire-damp which fills the cylinder with a pretty strong light; but when the foul air constitutes one-third of the atmosphere, it is no longer fit for respiration. In some forms of the lamp a glass cylinder is placed inside the wire gauze; this resists air-currents, and ensures a steadier light. Experience, however, has shown that Davy's lamp is not an absolute protection against the danger of explosion from fire-damp, and a perfect safety-lamp is still a desideratum.

safety-valve, *s.*

Steam-eng.: A valve which automatically opens to permit steam to escape or air to enter the boiler in order to prevent its explosion or collapse. Of these there are two kinds, the one internal, opening to the inner side when the pressure of steam is less than a given weight; the other opening to the outside when the pressure of steam exceeds a given weight. The latter is the more important, and consists commonly of a lever of the third class pivoted at one end; the valve, which is on a stem projecting from the lower side of the lever, is conical, and fits into a corresponding seat. The lever has notches for receiving the hook or loop of a weight which is suspended therefrom, and may be moved from one notch to another, like the weight of a steelyard, so that a greater or less amount of steam pressure may be required to lift the valve from its seat. In locomotive engines, it is fixed at one end to a stud, and rests on the valve at a short distance from this stud. Its length is proportioned to the area of the valve, and a spring-balance indicates the pressure in pounds per square inch on the boiler above atmospheric pressure. Safety-valves are also used with boilers of various kinds, air and gas engines, proving-pumps, and hydraulic-presses. Locomotive-engines have two valves placed on the boiler for the escape of steam when it exceeds certain limits. One of them is placed beyond the control of the driver, and is called the lock-up valve. The other is regulated by a lever and spring-balance at a little lower pressure than the lock-up valve.

A less amount is obtainable from *Caryota urens*, the Bastard Sago-tree, from *Phœnix farinifera*, and, in Java, from the pith of the Gebang-palm, *Corypha Gebanga*, and some of the Cycads.

This causes them to yield a quantity of saccharine matter, which may be boiled into sugar or be converted by fermentation into an intoxicating liquor. When the trees are exhausted by this drain on their energies, sago is obtained from the trunk, as much sometimes as 150 or 200 pounds from a single tree. They are timid, sluggish, lacertiform creatures, feeding on worms, slugs, snails, and insects. When alarmed, they exude from the pores of the back and sides a milky humour, injurious to small animals but innocuous to man. From this circumstance, Salamanders have probably

derived their popular reputation of being venomous, which, however, is totally without

foundation. Strange tales have been told of them from very early times, particularly that the icy coldness of their bodies enabled them to endure fire without being injured, and even to extinguish the flames in which they were placed. There are two species: *Salamandra maculosa*, the Spotted Salamander, from Central Europe and the mountainous districts on both sides of the Mediterranean, and *S. atra*, the Black Salamander, from the high mountains of Central Germany, France, and Switzerland. The young of this species undergo their metamorphoses in the body of the mother. A young tadpole prematurely extracted, and placed in water and watched by Mlle. Marie de Chauvin, lost its gills, which were replaced by others. It lived for fifteen weeks at the bottom of its tank, when the gills atrophied, and, after moulting, the animal quitted the water. The gill-clefts then closed, and it became an adult land-salamander.

sā'-lĭx, *s.* [Lat. = a willow; cf. Gael. & Ir. *seileach*; Wel. *helig*; Cornish *helak* = a willow.]

1. *Bot.:* Willow; the typical genus of Salicaceæ (q.v.). Catkins erect, their scales quite entire; perianth none, except one or two nectariferous glands; stamens two, combined into one, or two to five; stigmas two, entire or cloven into two. Known species 160. One reason why the species have been unduly multiplied, and why much difficulty exists in determining finally how many there are, is the occurrence of hybrids. The willow genus is popularly divided into sallows, osiers, and willows (q.v.). All are trees or shrubs, loving moist places and growing rapidly. They vary greatly in size, from *S. alba*, sixty feet high, valuable as a timber tree, growing with rapidity, and producing much wood, to *S. herbacea*, only a few inches. *S. arctica* and *S. polaris* go further north than any other known woody plants. The bark of many is used for tanning, and is about half as valuable as that of oak. Many are used for hoops and basket work, specif. *S. viminalis* [OSIER], *S. stipularis*, *S. rubra*, *S. Forbyana*, *S. triandra*, *S. mollissima*, and *S. vitellina*. One of the toughest is *S. purpurea*, and it has a very bitter bark. A resin exudes from the fragrant leaves of *S. pentandra*. Various Indian species are used for basket-work, the bark for tanning, and the young shoots and the leaves to feed cattle. Dr. Majendie, believed that the salicin made from some species was a febrifuge like quinine. He specially valued the European *S. purpurea*, *S. Helix*, *S. pentandra*, *S. Russelliana*, *S. vitellina*, and the American *S. eriocephala*, *S. nigra*, *S. conifera*. Dr. Garrod believed them useless for the purpose. A decoction of the bark of *S. Caprea* has good effect in psoriasis. In Egypt, the sweet-scented catkins of *S. ægyptiaca* are used in preparing a medicated water, said to be cardiac and sudorific. In England, *S. alba* and *S. rosmarinifolia* were once credited with similar properties. Willows are very common in the United States, there being about 25 species, usually found by water courses or along the sides of ditches. Of the introduced species the Weeping Willow (*S. Babylonica*) is most valued, its beautifully pendant branches and twigs giving it a highly ornamental appearance.

Ichthy.: The genus Salmo (q.v.), and especially *Salmo salar*, the most important of anadromous food-fishes, on account of its abundance and its rich, delicious flavour. Range, temperate Europe southwards to 43° N. lat., excepting rivers falling into the Mediterranean; in America its southern boundary is 41° N. lat. It is an extremely beautiful fish, very symmetrical, and its form is admirably adapted to rapid motion, even against powerful currents. It is distinguished from all other species of the genus by the form of the opercular bones, which show a rounded outline to the posterior edge of the gill-covers, the longest diameter of which to the nose would be in a line through the eye. In all other

usual migratory species the same line would pass below the eye. The adult male fish is readily distinguished by the lower maxillary bone and cartilage greatly protruding. This is very remarkable in spent-fish, and, if not absorbed, may hinder them from feeding, causing them to pine away and die. The tail of the full-grown Salmon is straight across, while in the grilse and young Salmon it is forked. The colour is a rich bluish or greenish gray above, changing to silvery white beneath, sprinkled above the lateral line with rather large black spots. It grows to a length of from four to five feet, though the female becomes mature at a length of about fifteen inches, and the male at a length of seven or eight inches.

"Speaking generally, the fish in its full-grown condition is known as the *salmon;* one on its second return from the sea is often termed a *gerling* in the Severn, or a *botcher* on its first return, when under five pounds weight, although the more general designation is *grilse;* when under two pounds weight, it is usually termed *salmon-peal* by fishmongers. From one to two years before it has gone to the sea, it is known as a *parr, pink, smolt, smelt, salmon-fry, sprag,* or *salmon-spring* (Northumberland), *samlet, brandling, fingerling, black-fin, blue-fin, shed, skegger, gravelling, hepper, laspring, gravel laspring, skerling,* or *sparling* in Wales. In Northumberland, a milter or spawning male is known as a *summer-cock,* or *gib-fish,* and a salmon as a *simen.* In the Severn, a salmon which has remained in fresh water during the summer without going to the sea is termed a *laurel.* After spawning, this fish is a *kelt* or *slut,* but a male is generally termed a *kipper,* and a female a *shedder* or a *baggit.* In the Ribble, according to Willughby, salmon of the first year are termed *smelts,* of the second year *sprods,* of the third year *morts,* of the fourth year *fork-tails,* of the fifth year *half-fish,* of the sixth year *salmon."—Day: Fishes of Great Brit. & Irel.,* ii. 68, 69.

The Salmon is an anadromous fish, entering rivers mostly to spawn in a locality where the eggs will be hatched and the fry reared. It has been surmised that some enter rivers to rid themselves of marine parasites. During the summer months the Salmon roams along the coasts, loitering in estuaries and near the mouths of rivers. On its way to the breeding grounds in the upper reaches the Salmon has many obstacles to encounter, and salmon ladders are fixed by the proprietors of fisheries to help the fish in its ascent. The eggs are deposited in a gravelly bed, and their deposition and impregnation occupies about ten days. The male, as a rule, keeps guard near his partner, and the *Zoologist* (1847, p. 1,650), gives an animated account of a battle between two males, probably for the possession of a female, in which the victor inflicted mortal injuries on his foe. When the young fish emerge from the egg, the umbilical vessel is still attached to their stomachs, and the nourishment contained therein serves them for several weeks, during which time they lie concealed among the stones at the bottom of the stream. Till their second year they remain in the river, when they commence their migratory career. The pollution of rivers and other causes have led to a great diminution in the numbers of Salmon, and for many years their artificial propagation has been successfully carried on. Salmon were formerly exceedingly abundant in the rivers of New England and eastern Canada, but their numbers have been greatly reduced by indiscriminate fishing, while from some rivers, once full, the Connecticut, for instance, they have disappeared. In some rivers of the Pacific States, particularly the Columbia, they are very abundant, though over-fishing is causing a rapid decrease in their numbers. The rivers of Alaska also contain salmon in abundance. Great quantities are annually canned in the Pacific region, whence they are sent to all parts of the world. The government is actively engaged in the effort to restock these streams with salmon, and also to prevent the destructive methods of fishing in vogue.

1. *Chemistry:*

(1) (*Sing.*): [Sodium-chloride].

(2) (*Pl.*): Applied in a general sense to compounds of a metal and a halogen, as sodium chloride, NaCl; and to compounds formed by the union of an acid and a base, nitrate of silver, $AgNO_3$. In its fuller signification the term suggests a compound which can suffer rapid double decomposition with another soluble substance, as when solutions of chloride of sodium and nitrate of silver are mixed together, they at once decompose each other and form chloride of silver and nitrate of sodium. By an extension of meaning the name is sometimes applied to compounds, as chloride of ethyl, acetate of ethyl, and even to fats, as stearin, tristearate of glycerin. Popularly and medicinally the term salts refers to Epsom salts (q.v.).

2. *Comm., &c.:* There are extensive mines of rock-salt at Wielitska, near Cracow, which have been worked since 1251. Extensive subterraneous excavations have been made, the roof being supported by pillars of salt, and parts of the area cut into the form of churches, chapels, &c. The salt is impure, being mixed with clay. To purify it, it is dissolved in water, and then evaporated. The salt-beds of Northwich, in Cheshire, are also very extensive. They have been known since Roman times, and have been worked since 1670. The salt is cut from the bed in masses of five to eight feet in diameter, and then crushed with rollers. Afterwards it is dissolved in salt water, evaporated, and crystallized. One of the most abundant deposits of rock-salt in the United States is on Petit Anse Island, Louisiana. In these beds the salt is practically inexhaustible in quantity and remarkably pure in quality, so as to need little or no preparation. The other important localities of salt production in the United States are in the states of New York and Michigan. Here the salt is pumped up as brine, and recovered by evaporation. Salt is not alone used for seasoning and preserving food, but to glaze pottery, to harden soap, &c.

Salvation-army, *s.*

Ecclesiol. & Church Hist.: A religious organization virtually constituting a distinct religious sect, its founder and general being Mr. William Booth, born at Nottingham in 1829. In 1843 he entered the ministry of the Methodist New Connexion, which stationed him in London. Soon afterwards he obtained great spiritual success at Guernsey, and in 1844 was set apart as an evangelist. In 1856-7 he returned to the regular pastorate, but felt himself out of his sphere; and when, in 1861, the Conference refused to allow him again to become an evangelist, he resigned connection with it, and commenced an independent career. A year before this, Mrs. Booth had begun to preach. In 1862-3 he laboured in Cornwall, Newcastle, &c., and in June, 1865, in Whitechapel, London, where

he obtained many converts, whom he united into the East London Christian Revival Society, afterwards the East London Christian Mission. Visits to other cities and towns commenced the work also there. In 1865–6 Mr. Booth hired a large theatre, and, in 1870, the People's Market at Whitechapel. By the commencement of 1878 thirty stations had been occupied; at its close there were eighty, and the evangelists had increased from thirty to 127. The first appearance of the title Salvation Army in the Registrar-general's returns was in 1880. With the name army came military phraseology. Prayer became knee-drill, the leader became a general, one of his sons chief of the staff, evangelists took the name of officers, candidates were cadets, and not merely converts were sought, but recruits. A semi-military attire was assumed, barracks built instead of separate residences, and when the army marched forth to take some place by storm, it was with banners displayed and bands of music leading the march. Its possession of the streets was not undisputed, especially in the earlier part of its career. [SKELETON-ARMY.] Religious soldier-life was open to women, and many female officers conducted evangelistic operations. [HALLELUJAH-LASSES.] The army grew rapidly in numbers in England, and sent missionary bodies abroad, some contingents reaching the United States and Canada, where they have been active in efforts to gain converts, but not very successful. Recently Mr. Booth has been earnestly engaged in the praiseworthy work of endeavoring to ameliorate the condition of the poor of his native country.

"The fifth anniversary meeting of the Scottish Division of the *Salvation Army* has just taken place in the City Hall, Glasgow. During the year they had added 19 corps or mission stations to their list, making up a total of 66 corps altogether in Scotland. There have been held altogether 31,764 meetings in the barracks during the year, and 16,895 open-air meetings. The paid officers number 145, at an average salary of twelve shillings and sixpence per week."—*Echo*, Nov. 11, 1886.

Script. Biog.: The last of the Jewish judges. [¶.]

¶ *The First Book of Samuel, The Second Book of Samuel:*

Old Test. Canon: Now two books, but formerly a single book, of the Hebrew Scriptures. The Septuagint separated them into two, calling them Βασιλειων (*Basileiōn*), πρώτη (*Prōtē*), and Δευτέρα (*Deutera*) = the first and second of the Kingdoms or Kings. The Vulgate, following the Septuagint, named them *Liber Regum Primus et Secundus* (1 & 2 Kings). In 1518 A.D. the dual arrangement was introduced into the Hebrew Bible, in which we now have (without vowel points) שמואל א ב (*Samuel* A = 1, and B = 2). The narrative opens with a domestic scene at Ramathaim-Zophim (the Two-Ramaths of the Zophites), an unidentified site in Mount Ephraim. There lived a man called Elkanah, with two wives, one of whom, Hannah, vowed that if God would give her a man child, she would dedicate him to the service of Jehovah (1 Sam. i. 1–18). Her prayer being answered, she named him Samuel [Etym.], and, keeping her vow, sent him at a very early age to minister in the sanctuary at Shiloh, under the charge of the aged high priest, Eli (ii. 1–21). God made use of Samuel to reveal to Eli the approaching destruction of his household, in punishment of his too indulgent treatment of his unworthy sons, Hophni and Phineas (22–36); and the judgment was soon after inflicted, Israel being defeated with great slaughter in a battle with the Philistines, Hophni and Phineas slain, and the ark of God captured (iv.). Hitherto the twelve tribes seem to have been little independent republics, only temporarily cemented when a judge was divinely raised up [JUDGES]; but on reaching full manhood, Samuel issued a manifesto, calling for repentance and religious revival, and summoned a general gathering of the people to Mizpeh, which was a great step to their permanent federation (vii.). From that time he was the virtual ruler, as well as the prophet and priest, of the Hebrews. In his old age he made his sons judges; but they were corrupt, and misused their authority. The people becoming weary of them and of the theocracy, and clamouring for a king (viii.), Saul was divinely chosen and anointed (ix.–xv.). On his rejection for disobedience to the prophetic voice, David was pointed out as his successor, and similarly anointed (xvi.). His high qualifications (xvi. 17, xvii.–xviii. 1–4) and his popularity subjected him to the persecution of the reigning monarch (5–30), and he had long to conceal himself in caves and deserts, or even take temporary refuge in a foreign and hostile land (xix.–xxx.). The first book closes with the tragic death of Saul at the battle of Gilboa (xxxi.). The second opens with David's lament over the king and his heroic and unselfish son, Jonathan (2 Sam. i. 1), and then narrates David's civil war with Ishbosheth, Saul's son (ii.–iv.), his reign for seven years and six months, at Hebron, over Judah, and for about thirty-three years over all the tribes (v. 5), at Jerusalem, which had been captured from the Jebusites, and made the national capital (v. 6–xxiv.).

The first book gives the history from B.C. 1171 to 1055 (?); the second from 1055 to 1017 (?). Samuel cannot have been the author of the two books, for he dies before the first is closed (1 Sam. xxv. 1). An editor or compiler, however, may have penned his narrative of Samuel's administration from a work by that judge; David's wanderings, from one by the prophet Gad (1 Sam. xxii. 5), and David's reign, from one by Nathan (2 Sam. xii. 1; cf. 1 Chron. xxvii. 24, xxix. 29). When the editor lived is very doubtful. He does not mention David's death, which looks as if the monarch were living; but, on the other hand, he mentions kings of Judah (1 Sam. xxvii. 6), as if the separation between the ten tribes and the two had already taken place. In the other direction this work appears to have been published before the revival of Mosaic institutions under Josiah; for it wholly ignores them, and the name of Moses occurs only twice in the books (1 Sam. xii. 6, 8). The Hebrew is very pure. Thenius, Keil, and Erdmann date it in the reign of Rehoboam, Dr. Payne Smith in that of Jehoshaphat, Havernick in that of Solomon, and Ewald in the second half of the Babylonian exile. It has always been acknowledged as canonical, and is frequently quoted or referred to in the New Testament, especially by St. Paul (Acts xiii. 20, &c.), and St. Luke (Luke ii. 4; Acts vii. 45, &c.).

1. A protection for the sole of the foot. It consists merely of a sole, with sometimes a shield at the toe and heel, leaving the upper part of the foot bare, and is secured by straps passing over the instep and around the ankle. Sandals were worn by the Jews, and most Oriental nations, as well as by the Greeks and Romans, but appear to have been to a great

extent supplanted, even among the Orientals, by shoes. Originally made of leather they became in time articles of great luxury, being made of gold, silver, &c., and ornamented.

The flowers are at first yellowish, but afterwards of a deep ferruginous hue. Though they are inodorous, the wood when cut, especially near the root, is highly fragrant. It grows in the dry region of Southern India, and in the islands of the Indian Archipelago. When felled the trunk is about nine inches or a foot in diameter. It is then barked, cut into billets, and buried in a dry place for about two months. It is largely exported from India to China and Arabia, and, to a certain extent, to Europe. The heart-wood is used in the East for carving, for incense, and for perfume. The seeds yield by expression a thick and viscid oil, burnt by the poorer classes in India. An essential oil is also distilled from the wood. Hindoo doctors consider sandal-wood sedative and cooling, and use it in gonorrhœa. The sandal-wood of the Sandwich Islands is derived from *Santalum Freycinetianum* and *S. paniculatum.* Red sandal-wood is the wood of *Pterocarpus santalinus,* growing in Coromandel and Ceylon. In British pharmacy it is used only to colour the compound tincture of lavender. In India the name is also given to *Adenanthera pavonina.*

Petrol. & Geol.: Any stone which is an agglutination of grains of sand, whether calcareous, siliceous, or of any other mineral nature. (*Lyell.*) Siliceous sandstones are the most common. They vary in compactness from scarcely cemented sand to a hardness approaching that of quartz rock. The grains may be held together by an iron oxide, or calcareous matter, or by simple pressure. When very fine in grain, they are called freestones; when coarse and composed of angular or subangular grains of sand, they become grits; when pebbly, pudding-stones. Loose and friable sandstones do not as a rule preserve fossils well. They are often deeply ripple-marked, and occasionally preserve footprints or the indentations made by old raindrops. Sandstones occur in nearly every geological formation from the Cambrian to the Tertiary. Many furnish building- and paving-stones. [RED-SANDSTONE.]

Jewish Antiq.: The superior court or council of the Jewish nation. Tradition says that it was instituted in the time of Moses, and consisted of seventy-one members, viz., the seventy elders appointed by God (Num. xi. 17–25), with the lawgiver himself as president; but the fact of its Greek derivation (see etym.) renders it highly probable that it did not arise till after the Græco-Macedonian period. It is never alluded to in the Old Testament, unless it be in 2 Chron. xix. 8. That work, however, may not have taken its final form till the period in question. The Sanhedrim may have developed from and succeeded the Great Synagogue. The tradition is that it had seventy-one members. If so, the number was probably fixed to put it in harmony with the court of Moses and the seventy, and, if the number of the seventy disciples sent out by Jesus was fixed to constitute with him seventy-one in imitation of the Sanhedrim, this would confirm the tradition. But, if Jesus followed Moses, and not the Sanhedrim, the apparent confirmation would fall to the ground. The Sanhedrim consisted of three classes: first, the heads of the twenty-four courses into which the priests were divided (1 Chron. xxiv. 4–6), with those who had been high priests (?)—the elders or heads of the people (Matt. xvi. 21, xxvii. 1–3), and the scribes, or lawyers (Matt. xxvi. 3). They sat in a crescent, the president, on a higher seat than the rest, in the middle, supported on the right by the vice-president, and on the left by a learned referee. Herod was summoned before the Sanhedrim for putting people to death, B.C. 47 (*Josephus: Antiq.*, xiv. 9, § 4), and Jesus was condemned by it for claiming to be the Messiah (Matt. xxvi. 57–66). Shortly before this it had lost the power of life and death (John xviii. 31), which is generally held to have fulfilled the Messianic prophecy in Gen. xlix. 10). It ended when Theodosius put the last president to death, A.D. 425.

Philol.: The ancient language of the Hindus, and the oldest and most primitive of the Indo-European tongues. It has long ceased to be a living language, but in it most of the literature of the Hindus is written, from the oldest portion of the Vedas onwards. [VEDA.] To the scores of tribes and nations of discordant speech in India Sanscrit has long been the sacred and literary dialect, and all the cultivated tongues of modern India are as full of Sanscrit words as the European tongues are of Latin. It is a highly inflected language, and to philologists is the most valuable of tongues, owing to its freedom from the corruptions and disguises of phonetic changes and from obliteration of the original meaning of its vocables.

The architecture of the bower is excessively tasteful, and scarcely a day passes without some fresh arrangement of the shells, feathers, bones, and other decorative materials, which they bring from long distances in the bush to ornament the bower and the platform on which it stands. They immediately appropriate every fragment placed within their reach when in confinement for the same purpose.

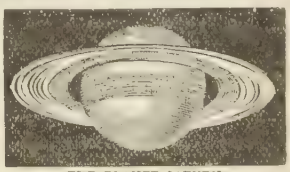
1. *Class. Myth.:* The youngest son of Cœlus (Uranus) and Gaia, the goddess of the earth. Being banished by Jupiter from heaven he fled to Latium, and was received by Janus, king of Italy, who made him his partner on the throne. Saturn occupied himself in softening the barbarous manners of the people of Italy, and in teaching them agriculture, and the useful and liberal arts. His reign there was so mild and beneficent that mankind have called it the Golden Age, to intimate the happiness and tranquillity which the earth then enjoyed. He is generally identified with the Greek Kronos, and the festival in his honour, called Saturnalia, corresponded with the Greek Kronia. He is generally represented as an old man bent through age and infirmity, holding a scythe in his right hand. His temple was the state treasury.

2. *Astron.:* The sixth of the major planets in distance from the sun. This averages 884,000,000 miles, and at certain times is nearly 1,000,000,000. It is the second planet in point of magnitude, having a mean diameter of 71,000 miles. To the eye it is as large as a fixed star of the first magnitude, and was known to the ancients. The equatorial diameter is about 74,000 miles, the polar 68,000. The large discrepancy indicates rapid rotation. This is performed in 10 hours, 14 minutes, and 23·8 seconds. Saturn's day is consequently not half the length of ours. But its year, fixed by the time of its revolution round the sun, is twenty-nine and a half earthly years. It moves through about twelve degrees of the sky in a year, enough to be noted by any ordinarily careful observer. The density of Saturn is one eighth that of the earth. Were water enough supplied for the purpose, Saturn would float with one fifth of its bulk dry. It is supposed that the materials of which it is composed are too greatly heated to condense into a compact body, but its weight is about eighty times that of the earth. Prior to 1610, Galileo, with his telescope which magnified thirty times, discovered three bodies projecting from the planet's disc, which in that year began to diminish in size. Huyghens, in 1655, proved these to be a ring. In 1675, J. D. Cassini showed that a black line divided the ring into two parts. These Maraldi, in 1715, and Sir Wm. Herschel, in 1790 (?), showed to be all probably separate rings. In 1850, Professor Bond, of Cambridge, Massachusetts, discovered a third ring, a dusky, semitransparent structure, which has been called a crape ring. Sir Wm. Herschel had proved in



THE PLANET SATURN.

1789 that the rings rotated in 10 hours, 32 minutes, 15 seconds. Astronomers have shown that, were the rings either solid or fluid, they must undergo disruption by unequal stress; and that they therefore probably consist of minute bodies like the meteorites surrounding the sun. On March 25, 1655, Huyghens discovered the first satellite of Saturn. Between 1671 and 1684 Cassini found five more. On August 28, 1789, Sir Wm. Herschel added a seventh, and on Sept. 19, 1848, Professor Bond, of Cambridge, Massachusetts, and Mr. Lassell, of Liverpool, an eighth. The names of the eight are: Titan, Japetus, Rhea, Dione, Tethys, Enceladus, Mimas, and Hyperion.

savings-bank, *s.* A bank the primary object of which is to encourage thrift and saving among the poorer classes. The first suggestion of savings-banks was made by Defoe in 1697, and the first to be established was that of Brunswick in France in 1765. In Germany the first savings-bank was founded at Hamburg in 1778. Others were soon after founded; at Berne in Switzerland in 1787, at Kiel in Denmark in 1796, and in other cities of Europe. The first step towards a savings-bank in England was made in 1799, by Rev. Joseph Smith, of Wendover, who offered to receive small sums from his parishioners to be returned at Christmas with interest. Others followed with similar philanthropic efforts, but the first one organized on thorough business principles was the Parish Bank Friendly Society, established by the Rev. Henry Duncan, at Ruthwell in Dumfriesshire in 1810. He published an account of this institution, and the idea was quickly taken up in other localities, so that by 1817 seventy savings-banks had been established in England. The first to be founded in the United States was in 1816 when the Philadelphia Savings Fund Society, suggested by Condy Raguet, was established in Philadelphia. In the same year the Boston Savings-Bank was started, and in 1819 one was established in New York. The system has since then been established in all parts of the civilized world, except in Germany (where institutions of a different character replace it), the banks being numerous and the aggregate sum of savings very great. In 1875 there were 1,054 savings-banks in the United States, with 1,793,361 depositors and $2,257,482 deposits. In 1880 there were about 550 banks, with 4,258,623 depositors and

$1,524,844,506 deposits. Post Office savings-banks were established in 1861 in Britain, and have been continued to the present day, with much success. This system has not been adopted in the United States. There is also in Britain a Government Annuity and Insurance system which is very closely connected with the savings-banks, and which has proved of great benefit.

1. *Anthrop.:* The Greeks claim the invention of the saw, but it occurs on the Egyptian monuments. Saws of the bronze age have been found in Germany and Denmark; and in the stone age rude saws of flint were affixed to wooden handles by bitumen. The Caribs formerly employed saws of notched shells, and the Tahitians of sharks' teeth.

2. *Carp.:* An instrument out with a serrated or dentated blade, the teeth of which rasp or cut away wood or other material, making a groove known as a kerf. The best saws are of tempered steel, ground bright and smooth: those of iron are hammer-hardened; hence the first, besides being stiffer, are likewise found smoother than the last. The edge in which are the teeth is usually thinner than the back, because the back is to follow the edge. The teeth are cut and sharpened with a triangular file, the blade of the saw being first fixed in a whetting-block. Saws are used to cut wood, stone, ivory, and other materials, and are either reciprocating or circular, and of various sizes and forms, according to the purpose for which each is intended. They may be divided into hand-saws and machine-saws, of which the first are the more numerous. Of hand-saws the most commonly used are the band-saw, the cross-cut saw, the frame-saw, the hand-saw, the panel-saw, the key-hole saw, the bow-saw, the ripping saw, the sash-saw, the tenon-saw, &c., which will be found described in this work under their several heads. Machine-saws are divided into circular, reciprocating, and band-saws. The circular-saw is a disc of steel with teeth on its periphery; it is made to revolve at great speed, while the material to be cut is pushed forward against it by means of a travelling platform. The reciprocating-saw works like a two-handled hand-saw, but it is fixed and the material pushed forward against its teeth. The ribbon-saw consists of a thin endless saw placed over two wheels, and strained on them. It passes down through a flat sawing table, upon which the material to be cut is laid.

They are common in tropical and less so in sub-tropical seas, and attain a considerable size, specimens with a saw six feet long and a foot broad at the base being far from rare. Their offensive weapon renders them dangerous to almost all other large inhabitants of the ocean. It consists of three or five (rarely four) hollow cylindrical tubes (the rostral processes of the cranial cartilage) placed side by side, tapering towards the end, and covered with a bony deposit, in which the teeth of the saw are implanted on each side. The real teeth are far too small to inflict a serious wound or to seize other animals, so that the sawfish use their rostral weapon in tearing off pieces of flesh from their prey or in ripping open the abdomen, when they seize and devour the detached portions or the protruding soft parts.

Saxon-architecture, *s.* The style of architecture in use in England from the time of its conversion till the Conquest. It is easily recognized by its massive columns and semicircular arches, which usually spring from capitals without the intervention of the entablature. In the first Saxon buildings the mouldings were extremely simple, the greater part consisting of fillets and plat-bands at right angles to each other, and to the general surface. The walls are of rough masonry, very thick, and without buttresses; the towers and pillars thick in proportion to height; the quoins are of hewn stone set alternately on end and horizontally; the arches of doorways and windows are rounded or with triangular heads; window-openings in the walls are splayed on to the interior and exterior, the window being in the middle of the thickness of the wall, and divided with a baluster of peculiar shape, especially in the belfries. In the earlier part of the Saxon period most of the domestic edifices built were of wood or mud with thatched roofs. In plan they were very rude. The fire was kindled in the centre of the hall, and, as there were no chimneys, the smoke made its way out through louvres, or by the doors or windows.

(5) In music, the sounds in consecutive order used by various nations in different forms as the material of music. In a proper succession such sounds form Melody, in proper combinations they constitute Harmony. The modern scale, universally used among the more civilized nations, consists of twelve divisions, called semitones, included in one octave. The ancient Greeks and Asiatics ancient and modern exhibit the use of less intervals. Such scales are called Enharmonic. Other nations have intervals of a third between some of the steps. This is exhibited in the Chinese and ancient Scotch scales, and in the scales of some savage nations. A scale containing only five unequal divisions of the octave has been called Pentaphonic or, less correctly, Pentatonic. All scales are purely arbitrary, consisting of a selection of sounds produced by the aliquot divisions of a monochord. When the divisions of a monochord are slightly altered to suit the required steps in an octave, as is the case in the modern scale, the scale is said to be tempered; when the harmonic divisions of the monochord are strictly followed, the scale is said to be in just intonation. The modern scale when used as a succession of twelve semitones is called Chromatic, when used in the ordinary mixture of tones and semitones it is called Diatonic, when the third and the sixth are flattened it is called the Modern minor diatonic scale, when the third and sixth remain major, the scale is said to be a Major diatonic scale. The scale is also called the gamut (French *gamme*) from the words *gamma* and *ut*, the names of sol and do, found in the Guidonian system of overlapping hexachords. The Italian names for the degrees of the scale, *ut, re, mi, fa, sol, la,* are derived from the initial syllables of a Latin hymn quoted in all musical histories. *Ut* was afterwards called *do* by many nations, and the name *si* was given to the seventh degree of the scale, when the ancient system of hexachords was converted into the modern system of octaves. When the scales, whatever the pitch, start from *do*, the system is said to be that of the movable *do;* when the first note of the scale is called *do, re, mi,* &c., according to a stated pitch called *do*, the system is called that of the fixed *do.*

scape-goat, *s.*

1. *Lit. & Jewish ritual:* A goat designed to 'scape, *i.e.*, escape, as opposed to one killed and offered in sacrifice. Once a year, on the great day of atonement, after Aaron had offered a bullock in sacrifice for the sins of himself and his house (Lev. xvi. 1–6), he was to take two goats "for a sin offering" (5). Lots were to be cast, one lot for the Lord, and one (8, A.V.) for Azazel (R.V., on the margin "for dismissal.") The goat on which Jehovah's lot fell was to be offered for a sin offering (9).

"But the goat on which the lot fell for Azazel shall be set alive before the Lord, to make atonement for him to send him away for Azazel into the wilderness." (10.) Cf. Matt. xii. 43; Luke xi. 24.

Before the dismissal, Aaron was to lay both his hands on the goat's head, and confess his sins and those of the people, putting them on the head of the goat, and send him by the hand of a trusty man into the wilderness, "and the goat shall bear upon him all their iniquities into a solitary land" (21, R.V.). If Azazel is an evil spirit [Azazel, 1], then after the sacrifice of the one goat had atoned for and removed the sins of the worshippers, the other scape-goat might return those sins in mockery to Azazel, the evil spirit regarded as their author. This is Hengstenburg's view. Rationalism, on the contrary, sees in the narrative a certain remnant of devil-worship flourishing perhaps in pre-Mosaic times. Under the later Judaism the goat was thrown over a precipice about twelve miles from Jerusalem. The scape-goat is generally considered the clearest type of the substitution of Christ for sinners, and his eternal removal of their transgressions cf. Isaiah liii. 11–12; John i. 29; Heb. ix. 28; 1 Peter ii. 24).

There are three varieties, *S. simplex*, *S. anginosa*, where the throat is chiefly implicated, and *S. maligna*, where the poison is so rapidly fatal as frequently to kill the patient before the chief usual symptoms develop. The eruption appears on the second or third day in the form of closely aggregated points about the size of a pin's head, with normal skin between, rounded and tending to become confluent. The period of desquamation, owing to excessive production of new epidermis, follows in two or three days. The eruption may be on the face only, the most frequent change being in the throat, the tonsils becoming swollen with catarrhal pharyngitis, tenacious mucous secretion, and œdema, with [illegible] difficulty in swallowing. Inflammation of the parotids and other glands often occurs, with suppuration and abscess, destroying the cell-tissues, with sloughing, and occasionally fatal hæmorrhage. The middle ear is frequently affected in the eruptive stage, often resulting in permanent deafness, and diphtheria is a not unusual complication, leading some observers to treat it as a symptom of scarlatina or eruptive maladies affecting the throat instead of a distinct disease. The scenery and general configuration of a district are often due rather to the facilities offered to the weathering of rocks along small and closely-disposed planes of fissure than to the presence of long lines of fracture and faulting.

(2) *Philos.:* One who pursues the sceptical system in philosophy. [SCEPTICISM, 2. (2).]

"Scepticism, meaning doubt, and being frequently used to signify religious doubt, has alarming associations attached to it. To call a man a *sceptic* is to call a man a heretic. And, unfortunately for Hume's philosophical reputation, he was a *sceptic* in Theology as well as in Philosophy, and mankind have consequently identified the former with the latter."—*G. H. (2) *Philos.:* The principle of universal doubt, or at least doubt with regard to the validity of all judgments respecting that which lies beyond the range of experience. (*Kant,* in *Ueberweg: Hist. Philos.* (Eng. ed.), ii. 32.) There were three schools of Scepticism in Greek Philosophy: (1) that of Pyrrho of Elis, in the time of Alexander the Great; (2) the

Middle Academy, beginning with Arcesilaus, who flourished towards the close of the third century B.C.; and (3) the Later Sceptics, beginning with Ænesidemus of Cnossus, who appears to have taught at Alexandria in the first century after Christ; they founded their teaching upon that of Pyrrho, and are often called Pyrrhonists. Scepticism found an active and able opponent in St. Augustine of Hippo (354–430), but revived somewhat in the Middle Ages, though at that period, as in later times, it dealt rather with the arguments by which theological teachings were sustained than with the teachings themselves and the philosophical doctrines corresponding thereto. The spirit of inquiry awakened by the Reformation and the Renascence, and the decadence of the Scholastic Philosophy, led men to recur to the ancient Greek systems, and Scepticism was revived and supported by Montaigne (1553–92), Pierre Charron (1541–1604), and Bayle (1647–1706) in France, and in England by Hobbes (1588–1679), Glanvill (1636–80, author of *Scepsis Scientifica*, and chaplain to Charles II.), and Joseph Hume (1711–76), whose philosophical scepticism incited Kant to the construction of his Critical Philosophy.

"Such is the battle-field, where *skepticism* and dogmatism contend. The controversy between them reduces itself to this question—Is human knowledge, or is it not, a faithful image of real being?"—*Jouffroy: Introd. to Ethics* (ed. Channing), i. 203.

Metaphysics:

1. Kant's name for a mediating factor rendering possible the application of the categories to phenomena. Such a factor he found in Time, since Time is, as a form *à priori*, homogeneous with the categories, and, as a

form of the sensibility, with phenomena. [KANTIAN-PHILOSOPHY.]

"The *schemata*, in the order of the categories (quantity, quality, relation, modality) are founded on the serial nature of time, the contents of time, the order of time, and on time as a whole. The *schema* of reality is being in time, and that of negation is not-being in time. The *schema* of substance is the persistence of the real in time; that of causality is regular succession in time; that of community, or the reciprocal causality of substances in respect of their accidents, is the simultaneous existence of the qualifications of the one substance with those of the other, following a universal rule. The *schema* of possibility is the agreement of the synthesis of diverse representations with the universal conditions of time, and hence the determination of the representation of a thing, as associable with some particular time; the *schema* of actuality is existence in a definite time, and that of necessity is existence at all times."—*De Morgan: Hist. 1. *Ord. Lang.:* A split or division in a community.

The word was afterwards employed by the fathers and theological writers to denote formal separation from the unity of the Church.

"He [St. Thomas Aquinas] thus explains the difference between heresy and *schism*. Heresy is opposed to faith, *schism* to charity, so that, although all heretics are schismatics, because loss of faith includes separation from the Church, all schismatics are not heretics, since a man [illegible] in the case of a large number of men."—*Addis & Arnold: Cath. schŏ-lăs'-tĭ-çĭsm, *s.* [Eng. *scholastic*; *-ism.*]

Philos. & Church Hist.: The name given to a movement which began with the opening of cloister schools by Charlemagne (742–814), attained its greatest development in the early part of the thirteenth century under Aquinas and Scotus, and, after receiving a check from the labours of Roger Bacon (1214–92) and the criticism of Occam (died 1347), gradually subsided at the Renascence. Scholasticism was the reproduction of ancient philosophy under the control of ecclesiastical discipline, the former being accommodated to the latter, in case of any discrepancy between them. It had two chief periods: (1) that from Scotus Erigena (died circ. 886) to the beginning of the thirteenth century, in which Aristotelian logic and Neoplatonic philosophemes were pressed into the service of the Church; and (2) from this time till the Renascence and the Reformation, marked by the adaptation of the whole Aristotelian philosophy to theology. Alexander of Hales (died 1245) seems to have been the first scholastic who was acquainted with the whole of Aristotle's works and the Arabian Commentaries thereon. In the first period arose the Nominalists and the Realists; in the second the Scotists and the Thomists. [See these words; Schoolmen.]

"But when the belief of the Church had been unfolded into a complex of dogmas, and when these dogmas had become firmly established, it remained for the school to verify and systematize them by the aid of a corresponding reconstruction of ancient Philosophy; in this lay the mission of *Scholasticism*."—*Ueberweg: Hist. [illegible]

B. *As adjective:*

1. Pertaining or relating to a school or to education: as, *school* customs.

¶ Education in the earliest periods seems to have been mainly domestic; the parents imparted it, and its character was religious (cf. Gen. xviii. 19; Exod. xiii. 14). Scholars are mentioned in 1 Chron. xxv. 8 and Mal. 11, 12, but nowhere in the Old Testament is there a word for school, though, according to Dr. Ginsburg, eleven words having that meaning were introduced into Hebrew between the return from Babylon and the close of the Talmudic period. The words for school in most European languages being from the same root, and the Mauratta *sal* = school, being apparently so, schools among the Aryans must be carried back to a remote period. Among the ancient Greeks, both boys and girls were taught at public schools (cf. Acts xix. 9; Gal. iii. 24, 25), as was the case with the Romans. The view that India has for centuries possessed a system of village schools, attended by all the boys, is much beyond the truth, and even now only a fraction of the Indian population can read.

In England the procedure of the law courts called "benefit of clergy" (q.v.) shows that for centuries there was scarcely a layman even of rank who could read. Schools therefore were designed chiefly for the education of ecclesiastics. Some were founded in the seats of bishoprics or archbishoprics; thus, Canterbury school existed at least as early as 1321, and Winchester school and college in 1387. There were various endowed schools in connection with religious foundations, and schools for teaching "grammar" and singing in connection with the chantries. The dissolution of the monasteries under Henry VIII., and of the chantries under Edward VI. led to the establishment of several endowed public and grammar schools. Those founded under the latter ruler are called King Edward's Schools. They still remain, and are wealthy. Eton College was founded in 1541, Christ's Hospital or the Blue-coat School in 1552, Winchester refounded in 1560, Rugby founded in 1567, and Harrow in 1585. These "grammar" schools, *i.e.*, schools for teaching Latin and Greek, were, as a rule, for poor orphans, but the education given was one suitable to the upper and middle classes, and in practice they have scarcely affected the lower classes. During mediæval times the view that ignorance is the mother of devotion had helped to keep the masses ignorant. To this succeeded the middle and upper class prejudice, not now often avowed, but secretly held by many, that to teach the poor would render them discontented with their lot. The first great improvement arose from the establishment in 1783 in England of Sunday-schools (q.v.). During the present century a system of schools for elementary education has gradually developed in Britain, under the form of parish schools, conducted under church superintendence, and supported by parliamentary grants, local school rates, and payment by pupils. The schools have gradually grown more secular in their management, the church influence and the amount of religious instruction decreasing. In the board-schools of the present system the attendance of children is compulsory, the funds for school support being derived from various sources. [BOARD SCHOOL, ¶ (1).]

In the United States a system of common school education was early instituted, every colony in New England before the middle of the first century of its existence having made education compulsory. In the other colonies education was greatly neglected, except in Pennsylvania, where a school was opened in the first year of the colony, and a free academy established at Philadelphia in its sixth year. After the Revolution active steps were taken for the advancement of education. In this the national government took no part, each state establishing its own school system, making its own appropriations, and passing its own laws. In all but the older states one-sixteenth of the public lands has been set aside for the support of education, and in all the states education in the primary and grammar schools is gratuitous, while in some education in high-schools is also gratuitously provided. As regards compulsory attendance the law varies, it being required in many of the states, but not demanded in all, and not uniformly enforced. The great cities, and many of the counties, form administrative districts for educational purposes, making their own regulations and appropriations and appointing their own school officials. In many of them handsome and thoroughly-appointed school buildings have been erected, and in the high schools the grade of education is coming to vie with that given in many colleges. Latin and Greek are taught, but more attention is given to modern languages and physical science and less to the classics than in schools of the same character in Europe. The Kindergarten method for younger children has been added to the school system in some of the larger cities and towns, while manual training and instruction in elementary art are becoming essential elements of the system of common school education.

In various countries of Europe the system of public education has made great progress, particularly in Germany, whose schools have the reputation of being the best in the world. The existing system began there in 1854, and is a thoroughly organized one, even private or pay schools being required to submit to public superintendence, and their teachers to obtain government diplomas. Education in that country is only in part gratuitous, the payment of school fees being required in the majority of schools, but attendance, between the ages of six and fourteen, is strictly compulsory. Similar development of the public schools has taken place within the present century in all the countries of Europe, France in particular having paid much attention to this subject. A recent statement in regard to fees and gratuitous education says that in France, Norway, Sweden, and parts of Switzerland education is free; in Italy, Bavaria, and Belgium it is generally free; in the other countries there is a mixed system, education being to some extent free, but more generally fees being charged. In most countries there is a fixed and definite system, except in England, where the school system has grown out of old conditions and has not definitely grown into new ones. It is of interest to state, in conclusion, that Japan has adopted a well-organized system of public school education, based on that of the United States, and is making quite striking progress therein.

Board Schools: A payment made by or on behalf of a pupil for admission to and instruction in a school. Specially applied to the sums payable by law by parents on behalf of their children attending public elementary schools under the Education Act (1870) and amending Acts. Such fees are payable weekly in advance, no legal means being available for the recovery of arrears. Children who present themselves without their fees may be refused admission, but the managers of each school have power to remit the fees on proof of poverty or like reasonable excuse. Parents refusing or neglecting to send their children to school, or to pay the fee, may be summoned and fined, the fine being recoverable by distress.

¶ In 1886 the London School Board made a regulation, which was put in force as cautiously as possible, that children not bringing the fee should be sent home. "The first *schooner* ever constructed is said to have been built in Gloucester, Massachusetts, about the year 1713, by a Captain Andrew Robinson, and to have received its name from the following trivial circumstance: When the vessel went off the stocks into the water, a bystander cried out, 'O, how she *scoons!*'—*i.e.*, glides, skims along. Robinson instantly replied, 'A *scooner* let her be;' and from that time, vessels thus masted and rigged have gone by this name. The word *scoon* is popularly used in some parts of New England to denote the act of making stones skip along the surface of water. . . . According to the New England records the word appears to have been originally written *scooner*." (*Webster.*) The New England *scoon* was imported from Clydesdale, Scotland, being the same as Lowland Scotch *scon* = to make flat stones skip along the surface of water; also, to skip in the above manner (applied to flat bodies), from A.S. *scúnian* = to shun, to flee, hence, to skip or speed along. The Dut. *schooner* and Ger. *schoner* are borrowed from English.]

This latter rig, formerly common, has now become rare. Square-rigged vessels have also lower fore-and-aft sails, denominated spencers or trysails, but these are small and are brailed up to the gaff when furled, instead of being lowered like those of a schooner.

* 1. Knowledge. (*Byron: Cain,* i. 1.)

2. Knowledge amassed, severely tested, coordinated, and systematized, specially regarding those wide generalizations called the laws of nature. Herbert Spencer thus classifies the sciences: (1) Abstract sciences: logic and mathematics; (2) Abstract concrete sciences: mechanics, chemistry, physics, &c.; (3) Concrete sciences: astronomy, geology, biology, sociology, &c. No science rests on a firmer base than mathematics, which, being founded on demonstrative evidence, may be accepted as absolutely true. The results in logic, which, like mathematics, is a deductive science, are much less certain; for error may creep into the premises, with the result of vitiating the conclusion. All other sciences are to a large extent inductive. These, resting only on probable evidence, are not really science, or knowledge, in the strict sense of the word, but continually approach nearer and nearer to it, as scientific methods improve. The sciences vary in the distance they have moved towards perfection, astronomy having gone far forward and therapeutics lagged behind. The inductive sciences may be divided into the men al and the physical. The former can largely be studied by reflection on our own mental operations; the latter require observation, experiment, comparison of the facts obtained, inductive and deductive reasoning, the whole ending in as wide generalization as the ascertained facts will permit. No one can be a truly scientific student unless he considers truth of priceless importance, and is prepared to sacrifice all preconceived notions and carefully elaborated opinions, whenever he discovers them to be erroneous. No expenditure of money, time, or even life, is considered extravagant if the sacrifice be made for the discovery of fresh truth. The initial stages in the evolution of the several sciences are to be sought in a remote period of antiquity. Moral science, a department of mental science, reached some degree of maturity first, early man desiring to ascertain what his conduct should be to his fellows and to his God or gods. Mental science, or the investigation of the thinking and feeling mind, came next; but, to this day, has made but slow progress, and is still far from certainty. Physical science had really commenced, though it was in its infancy, when ancient myths of observation were framed, many of which were hypotheses to account for natural phenomena. Its progress, slow till the eighteenth century, has since then been increasingly rapid. Prior to this, the greatest advances were made in astronomy and in physics, then in chemistry, botany, &c. Geology did not attract much notice till the beginning of the nineteenth century, and anthropology, comparative religions, &c., not till its second half. Though science has been prosecuted by its most earnest cultivators for its own sake, and not for the beneficial effects which the discoveries will have on mankind, yet those discoveries have already helped man incalculably. Railways, ocean steamers, telegraphy, gas, &c., all resulted from scientific inquiry turned to practical account.

3. Knowledge regarding any one department of mind or matter, co-ordinated, arranged, and systematized: as, the *science* of botany, of geology, &c.

† 4. Art or skill derived or resulting from precepts, principles, or training; exceptional or preeminent skill.

scor'-pĭ-ō, *s.* [Lat. = a scorpion.]

1. *Astrol.:* The "accursed constellation," the "false sign," ominous of war, discord, and woe. It is of "watery triplicity," and is attended at its setting by tempests and by autumnal diseases. Gadbury dissented from these views, having been born when Scorpio was in the ascendant. So did the alchemists, for they believed that iron could not be transmuted into gold except when the Sun was in the sign of Scorpio.

2. *Astronomy:*

(1) The eighth zodiacal constellation. It is bounded on the north by Ophiuchus and Serpens, on the south by Lupus, Norma, and Ara, on the east by Sagittarius, and on the west by Libra. It is a small but very brilliant constellation, especially when seen from places south of the equator. It contains Antares (q.v.) or Cor Scorpii (α Scorpii), of the first magnitude, and Ikiil, or β Scorpii, of the second magnitude.

4. *Zool.:* Any individual of the family Scorpionides (q.v.). The European species are three or four inches long, and confined to the southern parts of the Continent, but Scorpions have a wide geographical range in tropical and sub-tropical regions, and in Equatorial Africa and South America they grow to a length of nine or ten inches. The sting in the tropical species is much more formidable than that of the European Scorpion, though it may be doubted if it ever proves fatal to a healthy adult human being. They are nocturnal in habit, concealing themselves under stones, the loose bark of trees, and in crevices in walls, coming forth at dusk. They prey on other spiders and insects; and, seizing their prey in their palpi, which are practically useless as weapons of offence, sting it to death. The eggs are hatched in the enlarged oviducts, and the young, usually from forty to sixty, are carried about for some time on the back of the mother. Scorpions are very pugnacious, and the victor usually devours his conquered foe.

SCORPION.

"Though the well-known tale of the *scorpion*, when surrounded by fire, stinging itself to death, has been perpetually repeated . . . it must be held to be merely a traveller's story."—*Encyc. Brit.* (ed. 9th), ii. 286.

* **Scŏt'-ĭzm,** *s.* [See def.]
Philos.: A branch of Scholasticism (q.v.), named after its founder, Johannes Duns Scotus (born at Dunston, Northumberland, or, according to Wadding, in Co. Down, Ulster), a distinguished Franciscan friar, who taught in the schools at Oxford, Paris, and Cologne, where he died in November, 1308 (at the age of thirty-four, according to the generally received account). Scotism was a more pronounced form of Realism than Thomism (q.v.), and taught that the species is numerically one, assigning to each individual a *hæccitas*—something which gives individuality apart from matter; that the created will is the total and immediate cause of its own volition; that the creation of the world and immortality of the human soul are not demonstrable by human reason; that the opinion that the Virgin Mary never contracted original sin is the "more probable" (which led to the Franciscans being recognized as the champions of the Immaculate Conception); and that an action is not necessarily good or bad, but may be indifferent. In opposition to St. Thomas Aquinas, Scotus held that the secular power may be lawfully employed to compel Jews to enter the church.

"Although, therefore, Scotus' critique of the validity of the arguments for Christian doctrine might, and necessarily did, prepare the way for the rupture between philosophy and theology, and, although some of his utterances went beyond the limit which he prescribed for himself in principle, *Scotism* is none the less, like Thomism, one of the doctrines in which Scholasticism culminates."—*Ueberweg: Hist. II. *Technically:*

1. *Mach. & Mech.:* A cylinder surrounded by a spiral ridge or groove, every part of which forms an equal angle with the axis of the cylinder, so that if developed on a plane surface it would be an inclined plane. The screw is considered as one of the six mechanical powers, but is really only a modification of the inclined plane:

"Let us suppose a piece of paper in the shape of a right-angled triangle to be applied with its vertical side against a cylinder, and parallel to the axis, and be wrapped round the cylinder; the hypotenuse will describe on the surface of the cylinder a screw line or helix. If the dimensions be so chosen that the base of the triangle is equal to the circumference of the cylinder, then the hypotenuse becomes an inclined plane traced on the surface of the cylinder; the distance being the height of the plane. An ordinary screw consists of an elevation on a solid cylinder; this elevation may be either square or acute, and such screws are called square or sharp screws accordingly. When a corresponding groove is cut in the hollow cylinder or nut of the same diameter as the bolt, this gives rise to an internal or companion screw or nut. The vertical distance between any two threads of a screw measured parallel to the axis is called the pitch, and the angle is called the inclination of the screw. In practice, a raised screw is used with its companion in such a manner that the elevations of the one fit into, and coincide with, the depressions of the other. The screw being a modification of the inclined plane, the conditions of equilibrium are those which obtain in the case of the plane. The resistance, which is either a weight to be raised or a pressure to be exerted, acts in the direction of the vertical, and the power acts parallel to the base; hence we have $P : R = h : b$, and the length of the base is the circumference of the cylinder; whence $P : R = h : 2\pi r$; r being the radius of the cylinder, and h the pitch of the screw. The power is usually applied to the screw by means of a lever, as in the bookbinders' press, &c., and the principle of the screw may be stated to be generally that the power of the screw is to the resistance in the same ratio as the pitch of the screw bears to the circumference of the circle through which the power acts."—*Ganot: Physics* (ed. Atkinson), § 45.

A convex screw is known as the external or male screw, a concave or hollow screw (generally termed a nut) is an internal or female screw. The mechanical effect of a screw is increased by lessening the distance between the threads, or by making them finer, or by lengthening the lever to which the power is applied; this law is, however, greatly modified by the friction, which is very great. The screw is used for many purposes; ordinarily to fasten things together; for the application of great pressure it is employed in the form of the screw-jack, screw-press, &c.; as a borer it is used in the form of the gimlet; for fine adjustments, as in telescopes, microscopes, micrometers, &c., it is invaluable. The great attrition or friction which takes place in the screw is useful by retaining it in any state to which it has once been brought, and continuing the effect after the power is removed. The parts of a screw are the head, barrel or stem, thread, and point. The head has a slit, nick, or square. In number screws vary, as single, double, triple; the numbers representing the individual threads, and those above single being known as multiplex-threaded.

2. A piece of sculpture; carved work; a figure cut or carved in wood, stone, or similar material, representing some real or imaginary object.

"What are to him the *sculptures* of the shield?"

¶ The origin of sculpture is lost in antiquity. An admirable material for early effort was found in clay, so widely diffused in many lands [Terra-cotta], to which, as knowledge advanced, were added wax, gesso, marble, bronze, &c. Hence the rudiments of sculpture are found among all races of mankind. The idolatry of the Old World gave it a great impulse, from the necessity which it produced of representing gods. [Idol.] Innumerable highly-antique sculptures remain belonging to the Egyptians; they are not confined to gods, but represent men engaged in their several occupations. To a certain extent it is the same with the Assyrian sculptures. Those of India are known chiefly in connection with Booddhism and the Later Brahmanism; they are more exclusively connected with religion. All these are mediocre specimens of art. It was reserved to the Greeks, and specially to the Athenians, to carry sculpture to the highest perfection, which Phidias did, about B.C. 442, and Praxiteles, about B.C. 363. The works of the former were characterized by sublimity, those of the latter by beauty. Praxiteles was the first who ventured to produce a wholly nude figure. The conquest and spoliation of Greece by the Romans, B.C. 146, led to the removal of Greek masterpieces to Rome. This ultimately created a certain taste for sculpture among the Romans, especially under the Emperor Augustus, but, as sculptors, the Romans never equalled the Greeks. Under the later emperors the art declined; under the barbarian invaders who next succeeded to power it all but expired. It was revived in Italy in the thirteenth century by Pisano, and gradually spread to other European countries. Among Italian sculptors were Donatello (1383–1460), Michael Angelo (1474–1564), and Canova (1757–

1322). Among the sculptors of the United States may be named Hiram Powers, Thomas Crawford, Horatio Greenough, and William W. Story. Those of England include John Flaxman, John Gibson, and others of reputation. Thorwaldsen, of Danish birth, is the most famous of modern sculptors. Among living sculptors there are several of fine ability.

sea-serpent, *s.*

1. A sea-snake (q.v.).

2. An animal of immense size, and serpentine form, said to inhabit the ocean, but concerning which nothing definite is known. The first detailed accounts come from Norway. Pontoppidan (*Nat. Hist.* (ed. 1755) ii. 195) figures the Sea-serpent raising itself from the water and spouting, but the *Encyclopædia Britannica* (ed. 9th), xxi. 609, matches the figure with that of a squid. In more recent times several appearances of the "sea-serpent" have been recorded; notably by Captain M'Quhæ, of H.M.S. *Dædalus* (*Times*, Oct. 9, 1848, figured in *Illus. Lond. News*, Oct. 28, 1848), by Capt. A. Hassel (*Graphic*, Aug. 17, 1872), by the master and crew of the *Pauline*, of London (*Illus. Lond. News*, Nov. 20, 1875), by Lieut. Haynes, of the Royal yacht *Osborne* (see illustration, and *Graphic*, June 30, 1877), by Major Senior, from the *City of Baltimore* (*Graphic*, April 19, 1879), and by a clergyman at Busselton, West Australia (*Nature*, June 24, 1879). In these cases the observers testify to

SEA-SERPENT.

having seen a monstrous serpentiform animal, and their good faith is beyond question. Prof. Owen, in a letter to the *Times* (see *Illus. Lond. News*, Nov. 25, 1848, where Capt. M'Quhæ's reply is also printed), maintained that the animal seen by Capt. M'Quhæ was a gigantic seal, *Macrorhinus elephantinus*; but whilst many Sea-serpent stories may be, and some certainly have been, satisfactorily explained away by deceptive appearance of well-known natural objects at a distance, and "Sea-serpent" remains cast on British and American shores have been proved to belong to well-known species, there is a growing tendency at least to suspend judgment in the matter. Agassiz says that if the Sea-serpent exist it must be closely allied to the Plesiosaur (*Geological Sketches*, i. 16), and P. H. Gosse (*Romance of Nat. Hist.* (1st ser.), p. 358) claims that it is a surviving Enaliosaur.

"It would thus appear that, while, with very few exceptions, all the so-called '*sea-serpents*' can be explained by reference to some well known animal or other natural object, there is still a residuum sufficient to prevent modern zoologists from denying the possibility that some such creature may after all exist."—*Encyc. Brit.* (ed. 9th), xxi. 610.

The most prominent symptoms are a state of general depression, giddiness, vomiting and derangement of the bowels, and urinary secretions. In some cases the symptoms are so severe as to threaten life.

"Innumerable preventatives and remedies have been proposed, but most of them fall short of the success claimed for them. No means have yet been discovered which can altogether prevent the occurrence of *sea-sickness*, nor is it likely that any will be found, since it is largely due to the pitching movements of the vessel, which cannot be averted."—*Encyc. Zool.: The English name for any individual of a group of Marine Carnivora, with resemblances in cranial characters to the True Bears on the one hand and the Otters on the other (*Proc. Zool. Soc.,* 1869, p. 34). They fall naturally into two families: the Phocidæ, or True Seals, and the Otariidæ, or Eared Seals. The body in the former is elongated and somewhat pisciform, covered with a short, thick fur, or harsh hairs, and terminated behind by a short, conical tail. The limbs are developed into flippers, and adapted for swimming organs, whilst they are practically useless on land (a modification foreshadowed in the hind-limbs of the Sea Otter), so that, when they leave the water, the True Seals can only drag themselves laboriously along, chiefly by contractions of the abdominal muscles. They especially abound in the Arctic and Antarctic regions, passing the greater part of the year in the sea, not far from the shore, to which, however, they invariably resort in the breeding season and to bring forth their young. The Common Seal (*Phoca vitulina*) occurs on the Atlantic coast as far south as New Jersey. It is abundant farther north. It is from three to five feet long, yellowish-gray in color, intelligent, and capable of attachment. The Eared Seals, almost exclusively confined to the southern hemisphere, are more closely allied to Land Carnivora than the True Seals, as they possess small external ears, and are able to use the hind limbs for progression on shore. The male Eared Seal is much larger than the female, which looks ridiculously small beside her lord. It is from one of this group that most of the seal-skins of commerce are obtained. [NORTHERN FUR-SEAL.] Seals are largely hunted for the sake of their blubber, which yields a transparent, inodorous oil; and the skins of those species which have no close under-fur [SEAL-SKIN], when tanned, are employed in making boots, and, when dressed with the hair on, serve to cover trunks, &c. The species of True and Eared Seals are numerous.

seal-fishery, *s.* The most important fishing-ground for hair-seals is off the coasts of Newfoundland and Labrador. The annual catch is about 500,000. There are others in the Gulf of St. Lawrence, off Nova Zembla, in the White and Caspian Seas, and elsewhere. The Prybiloff Islands are the seat of the most important fisheries for fur-seals, the catch there being restricted to 100,000 skins. The other fisheries, which are principally in the southern hemisphere, are in great measure exhausted. Within recent years the reckless destruction of the Bering Sea fur seals by Canadian fishermen, has been a subject of dispute between Great Britain and the United States. This question has been settled by international arbitration.

seal-skin, *s.* & *a.*

A. *As subst.:* The skin of the seal, which, when dressed with the hair on, is made into caps and other articles of dress, and, when tanned, into shoes, &c. The skin of the sea-bear or fur-seal, after the long coarse hairs, which cover a beautifully fine and silky fur, are removed, is dyed, and made into ladies' cloaks, muffs, &c. Only immature and female specimens of the fur-seal yield the seal-skin of commerce.

I. *Lit. & Astron.:* The alternations in the relative length of day and night, heat and cold, &c., which take place each year. In England there are four seasons, spring, summer, autumn, and winter. The Anglo-Saxons reckoned only three, spring, summer, and winter, the words for which are all from Anglo-Saxon, autumn (q.v.) was borrowed from the Romans. In India there are but three well-marked seasons of four months each, the hot (February–May), the rainy (June–September), and the cold (October–January). The essential astronomical fact on which the recurrence of the successive seasons depends is that the axis of the earth always points in the same direction, whatever portion of the orbit the earth may at the time be traversing. The inclination of the equator to the ecliptic is 23° 27′. On June 21, when the sun is at the highest point of the ecliptic, the north pole necessarily inclines towards the sun, and is as much irradiated as it ever can be by his beams, whilst the south pole, on the contrary, is as little. It is therefore midsummer in the

northern and midwinter in the southern hemisphere. Six months later, Dec. 21, the southern pole points towards the sun. It is therefore now midwinter in the northern and midsummer in the southern hemisphere. At the intermediate periods (March 21 and September 21), the axis of the earth is at right angles to the direction of the sun; hence, in both hemispheres it is the equinox, the vernal at the former date in the northern, and at the latter in the southern hemisphere.

Virginia followed in April, 1861, Arkansas and North Carolina in May, and Tennessee in June. The remaining slave-holding states failed to pass ordinances of secession, and declared themselves neutral, a declaration to which the national government paid little attention, in view of the fact that the majority of their people were loyal. The secession movement failed, and all the seceding states were re-admitted to the Union by 1870.

III. *Scotch Eccles. Hist.:* A religious body which broke off from the Established Church of Scotland in 1733. In 1730 the General Assembly had put an end to the practice of recording the protests occasionally taken by individual members against the decision of the church courts. Several protesting ministers soon after gave in their "secession" from the prevailing party in the Church, whence arose the name, "the Secession." On Dec. 6, 1733, they constituted themselves into an Associated Presbytery. Four more joined in 1737, and a first "Act and Testimony" was published. In 1747 an ensnaring burgess oath divided them into Burghers and Antiburghers. In 1806 the voluntary question [VOLUNTARYISM] led to another schism. In 1820 they were reunited as the Associated Synod, and in 1847, joining with the Relief (q.v.), constituted the United Presbyterian Church (q.v.).

secondary-rocks, *s. pl.*

Geology:

* 1. All sedimentary and fossiliferous rocks, as distinguished from the primary rocks below [PRIMARY] and the Tertiary alluviums and diluviums above.

2. An extensive series of stratified rocks, having certain characters in common distinguishing them from the primary rocks beneath and the Tertiary above them. Lyell divides the Secondary rocks into the Trias, the Lias, the Oolite, and the Cretaceous; Seeley into the Trias, the Lias, the Pelolithic, the Psammolithic, and the Cretaceous; and Etheridge into the Triassic, the Jurassic, and the Cretaceous. In many places the palæozoic strata had been fractured, contorted, and even thrown into a vertical position before the Secondary rocks began to be deposited. There is a break between the end of the Primary [PALÆOZOIC] rocks and the commencement of the Secondary strata. Though most of the latter seem conformable to each other, yet the considerable alterations ever and anon occurring in the character of the fossil remains suggest the existence of breaks not stratigraphically visible. Thus there is no visible unconformability in the Lias, yet only five per cent. of the fossils pass from the Middle to the Upper Lias. During the deposition of the Secondary rocks the geographical features of the northern hemisphere were again and again modified. From the Lias to the Chalk there seems to have been a series of large tropical islands, drained by considerable rivers, with a vegetation of Cycads, Reeds, and Conifers. Giant reptiles were the dominant vertebrates. Specially in the time of the Wealden was there in the S.E. of England a river draining a large area. A great break occurs between the Secondary and the Tertiary. Murchison says that gold is generally absent from Secondary rocks. [MESOZOIC.]

sĕc'-ụ-lạr-ĭşm, *s.* [Eng. *secular; -ism.*]

Hist.: The name given, about 1846, by Mr. George Jacob Holyoake to an ethical system founded on natural morality.

"*Secularism* is that which seeks the development of the physical, moral, and intellectual nature of man to the highest possible point, as the immediate duty of life—which inculcates the practical sufficiency of natural morality apart from Atheism, Theism, or the Bible—which selects as its method of procedure the promotion of human improvement by material means, and proposes these positive agreements as the common bond of union, to all who would regulate life by reason and ennoble it by service."—*G. J. Holyoake: Principles of Secularism* (ed. 1859), p. 17.

Moreover Secularism claims for its adherents four distinct rights:

1. The right to think for one's self, which most Christians now admit, at least in theory.
2. The right to differ, without which the right to think is nothing worth.
3. The right to assert difference of opinion, without which the right to differ is of no practical use.
4. The right to debate all vital opinion, without which there is no intellectual equality—no defence against the errors of the State or the pulpit.

On this basis the National Secular Society was founded in 1866, and had on Dec. 31, 1886, a membership of 14,830.

2. *Geol.:* Earthy or other matter which, after having for a time been suspended or held in solution in water, is deposited at the bottom. It is produced wherever there is water in motion, and the strata which it calls into existence may consequently be lacustrine, fluviatile, or marine. It often alters its area of deposition: thus, if a lake which intercepted it be filled up, it may pass along a river traversing that lake, and be deposited many miles away in the sea. Volcanic movements altering the levels of a country affect it greatly. It is of the same colour as the materials from which it was derived, if these are homogeneous. It is perpetually deposited through the globe on a colossal scale, and has in process of ages created the sedimentary rocks. The International Geological Congress (1881) recommended the following terms for describing sedimentary strata: a *group* requiring an *era*, a *system* requiring a *period*, a *series* requiring an *epoch*, and a *stage* requiring an *age* for its deposition. A stage is divided into beds, for which a corresponding chronological term has not yet been fixed. On this plan one would speak of the Secondary or Mezozoic group and era, the Oolitic system and period, the Upper Oolite series and epoch, and the Middle Purbeck stage and age.

II. *Bot. & Veg. Physiol.:* A mature ovule. As a rule, it remains modelled on the same plan, though minor changes may be produced by the suppression, addition, or modification of certain parts. The side of a seed most nearly parallel with the axis of a compound fruit, or with the ventral suture or sutural line of a simple fruit, is called its face; the opposite side, its back. When a seed is flattened lengthwise, it is said to be compressed; when vertically, it is depressed. It is attached to the placenta by the hilum (q.v.) or umbilicus. The opposite point is its apex (q.v.). The integuments of a seed are called its testa; the rudiments of the future plant, its embryo, and a substance often interposed between them, albumen (q.v.). [CHALAZA, RAPHE, ARIL COTYLEDON.] Except in the Gymnosperms, the seeds are enclosed in a pericarp, often strong, which defends them from cold or from injury. Within a country, a balloon-like pappus, hooks, &c., can disperse seeds. Most of them, however, even when defended by their pericarps, cannot be long in salt water without being injured; still, Darwin calculated that one-tenth the plants of a flora might be floated across 900 miles of sea, and after all germinate. They could be taken yet farther in the gizzards of birds, in particles of earth adhering to their feet, or among soil floated on icebergs. On shore, melon seeds have been known to grow when forty-one years old, maize when thirty, rye when forty, the sensitive plant when sixty, and the kidney bean when 100. The old story about seeds taken from a mummy-case germinating is not now believed. [MUMMY-WHEAT.] In some countries laws have been passed against the adulteration of seeds.
